

AERECO, AIR ON DEMAND

Everyone knows that air quality is a decisive factor when it comes to comfort at home and in the office. Additionally, modern building regulations make cutting energy costs a major priority. Aereco has been meeting these demands by designing and manufacturing innovative demand controlled ventilation systems for 35 years since it invented the humidity sensitive ventilation system in 1984.

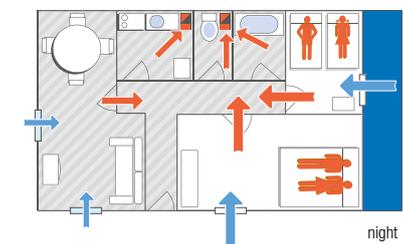

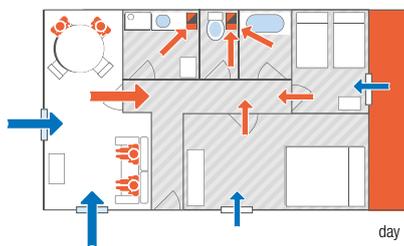

Today, Aereco continues to pursue its research, consistently offering new intelligent ventilation solutions that are adapted to the specific needs of dwellings and office buildings. The humidity sensitive ventilation process is a landmark in demand controlled ventilation systems. It has bestowed upon Aereco and its products an image that guarantees quality and technical know-how, making Aereco a formidable player in the ventilation sector the world over. In conjunction with its commercial activities, the company is engaged in improving regulations in the various countries it trades in, in order to optimise the position that ventilation holds in the construction industry. Aereco, with its head office and factory at Marne-la-Vallée, in France, is represented worldwide through numerous subsidiaries and distributors.

WHY DEMAND CONTROLLED VENTILATION?

Balance indoor air quality and energy savings with demand controlled ventilation

It is commonly accepted that most water distribution facilities work on demand, and not permanently. Thus why should it be different for ventilation, with each cubic meter of fresh air to warm during all the heating season having a significant economic and environmental cost?

The concept of demand controlled ventilation rests on the principle of providing occupants with the right amount of fresh air, when they need it, where this is useful. With intelligent airflow management, energy savings are made on every occasion that the need for ventilation is low, which can represent more than half the time. Conversely, an activity which emits indoor air pollution such as preparation in a kitchen, a shower, or even the release of odorous metabolic compounds, generates a need for a greater ventilation to remove the pollution quickly, which can be achieved through demand controlled ventilation.

At every moment, demand controlled ventilation offers an optimization of heating consumption and indoor air quality, on a fully automated basis. Every Aereco ventilation system is design on this concept of demand controlled ventilation, which beyond being particularly effective for the comfort of the occupants offers many other benefits as presented later.

1. Humidity sensitive air inlets open in direct proportion to the occupancy of the rooms.

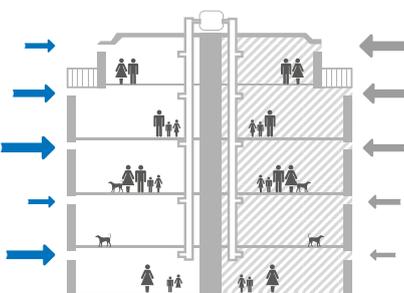

How does it works?

Intelligent airflow distribution inside the dwelling (1)

The Aereco demand controlled ventilation system optimises air distribution within the dwelling: thanks to the humidity sensitive air inlets, it directs the most air to the rooms that need it most. In this way, the system limits heat losses in unoccupied rooms and provides good ventilation where it is needed. The same principle is used at the exhaust through demand controlled exhaust units.

An airflow always automatically adapted to the pollution and to the occupancy (2)

To meet the variable need for ventilation, Aereco ventilation systems provide an airflow automatically determined by the level of pollution or occupancy inside each dwelling, contrary to the constant airflow ventilation systems. Thus the residences with higher occupancy or pollution benefit from more ventilation to offer a good indoor air quality; the residences where occupancy is less have a lower airflow, saving energy both on heating and on fan electrical consumption.

2. Aereco demand controlled ventilation | constant airflow ventilation

DIRECT ADVANTAGES OF DEMAND CONTROLLED VENTILATION (DCV)

IAQ Better air renewal for greater comfort

By providing the best ventilation for the places that need it most, Aereco's demand controlled ventilation systems largely contribute to improving air quality in dwellings. When a main room is occupied, its relative humidity increases; the air inlets then open more to increase airflow and better evacuate stale air. Activity in wet rooms (kitchen, bathroom, toilets, etc.) is accompanied by water vapour emissions; the opening of the exhaust units increases with the relative humidity, increasing the airflow and so evacuating polluted air more rapidly.

Protection against moisture

The higher relative humidity generated by breathing and human activity in the kitchen or shower, for example, can lead to destructive condensation, in which moulds can grow. When the relative humidity increases dangerously, humidity sensitive exhaust units open quickly to evacuate excess moisture and eliminate the risk of condensation.

Reduced and controlled heating consumption

Ventilation is often held responsible for a large share of the thermal losses in a dwelling, sometimes as much as 50%. While this is true of the majority of traditional ventilation processes, Aereco systems preserve heat in less occupied rooms and dwellings by automatically reducing the airflow.

NUMEROUS ADDITIONAL BENEFITS

In addition to combining indoor air quality and energy savings optimisation, **demand controlled ventilation demonstrates many indirect benefits resulting from the reduction of average airflow:**

Reduced average power consumption of the demand controlled exhaust fan

By reducing the average airflow rate, demand controlled ventilation systems allow the exhaust fan to work well below the maximum airflow, thus at a very low power. This aspect clearly promotes unbalanced demand controlled ventilation systems such as those from Aereco, when compared with the standard heat recovery ventilation systems that typically have two motors operating at a higher speed (with higher average airflow), and are then particularly penalized in terms of environmental impact and consumption of electrical energy (primary notably).

Less clogging of filters, air ducts and terminals

The inherently reduced airflow of demand controlled ventilation leads to the reduction of the total amount of particles that can clog the components of the system. Thus, maintenance of air ductwork and filters (where these have been used), can be reduced with the power consumption of the demand controlled exhaust fan (when presence of filters).

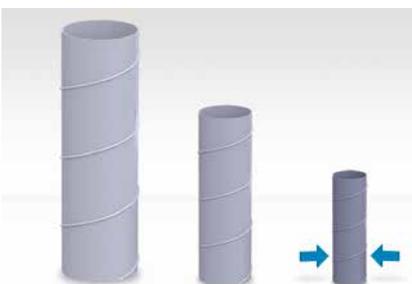

Increased lifetime of fans

By reducing average airflow over the year, demand controlled ventilation permits a reduction of the demands placed on the exhaust fan, and thereby increases its longevity. This result is the consequence of the fact that the fan longevity depends in particular upon the power at which it works, the power being directly linked with the average airflow.

Greater availability of pressure and airflow for exhaust grilles

In a collective air ductwork system, the airflow modulation permits the avoidance of overloading the air ducts with unnecessary airflow rates, as it would be the case with a constant airflow ventilation system. Thus, the rooms or dwellings with a low airflow requirement release the air duct for the rooms or dwellings with a higher need for ventilation. These last can then benefit from all the pressure and airflow potential of the ductwork.

Reduced size of air ductwork to gain on valuable floor space

In demand controlled ventilation, airflow modulation permits a reduction in the size of the ventilation ductwork as not all of the connected exhaust vents work at the maximum level simultaneously. The air ductwork can therefore be sized for a total airflow lower than the sum of the maximum airflows, unlike that of a constant airflow ventilation system where the size of ducting corresponds to the strict sum of airflow. This use of smaller air ducts, can thereby allow a reduction in the total floor space required for ducting. The time dispersion of the ventilation needs has been verified during numerous in-situ experiments.

INTELLIGENT SENSORS

Aereco ventilation components include smart sensors that manage the airflows according to the needs and to the inner pollution. Different sensors are proposed in the products, depending on the room type and of the pollution.

Aereco system's major activation modes

Humidity sensitive airflow, created by Aereco in 1984

Airflow activated by presence detection

Airflow activated by a CO₂ sensor

Airflow activated by a VOC sensor

Airflow activated by a remote control

Manually activated airflow

Humidity sensitive airflow

Principle: the airflow is controlled by the local relative humidity. The detector and actuator of the humidity sensitive products, the sensor, makes use the tendency of polyamide strips to become longer when the relative humidity of the air increases and shorter when it decreases. This principle is used to activate one or more shutters, thereby adjusting the passage of the air according to the ambient relative humidity. The higher the humidity in the room, the wider the shutters open. The sensor is isolated from the incoming airflow; it measures only the interior moisture content. Moreover, thanks to a thermal correction, the opening of the shutters is unaffected by the external climatic conditions. Aereco's humidity sensitive technology is applied to air inlets, grilles, and exhaust units located in the rooms where the humidity reflects the level of indoor pollution (lounge, bedrooms, bathrooms).

Airflow activated by a presence detector

Principle: automatically increase the airflow when a presence is detected in the room. The presence of somebody in the room automatically activates the detector, which then opens the shutters of the exhaust unit for maximum airflow. This process is used when moisture is not sufficient to reveal of a high pollution level. This technology makes it possible to save heating energy during the period of non-detection. The presence detection module comprises a pyroelectric sensor that detects infrared radiation focused by a Fresnel lens, with a 4-meter range and a 100° angle of detection. The presence detection technology is used on exhaust units and mechanical ventilation terminals in rooms where the relative humidity cannot be used as an indicator of the pollution level (toilets, offices, etc.).

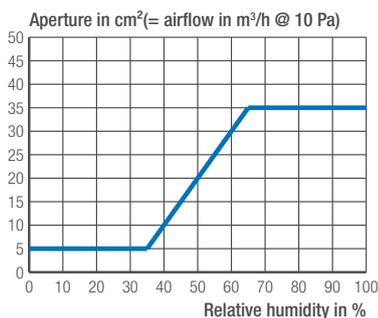

Manually activated airflow

Principle: let the occupant increase the exhaust airflow at times of intensive pollution. Where the relative humidity cannot be used as an indicator of high pollution (kitchen, toilets, etc. in use) the occupant can manually activate the maximum airflow at the exhaust unit to quickly evacuate stale air, unpleasant odours, and excess moisture. This boost can be activated by a push button ('on-off switch'), by pulling a cord, or through a remote control. This function can also supplement a humidity sensitive function on an exhaust unit.

Airflow activated by a CO₂ or VOC sensor

Principle: control the airflow automatically according to the level of CO₂ or VOC. Both sensors operate the same way: the opening threshold is selected at the time of installation. When the level of CO₂ (or of VOC, depending on the version of the product) is below the opening threshold, the airflow is at the baseline rate (minimum). When the level of the pollutant rises above this threshold, the exhaust grille opens to the maximum airflow for as long as the level of pollution exceeds the preset threshold.

**AERECO, A SOLUTION
FOR EVERY VENTILATION TECHNIQUE**

MECHANICAL EXHAUST VENTILATION WITH DEMAND CONTROLLED AIRFLOWS

High performance through affordable ventilation solution

Aereco's Mechanical Exhaust Ventilation system with room-by-room demand control of airflows is mainly used in Residential buildings, but it can also be installed on office or school buildings, notably. This system conciliates energy performance and indoor air quality through a very affordable solution, easy to implement in the new built as well as in refurbishment.

With the promise to deliver the designed airflows, the MEV system is the Aereco's most popular solution, from social housing associations to private owners. By proposing a humidity controlled air supply in the dry rooms and a humidity or presence – notably – control of the air exhaust in the wet rooms, the MEV system offers a very smart management of airflows in all rooms.

This system can be used either in collective management (multi-family buildings) through a common centralised fan, or individually, with one fan per dwelling (multi-family buildings or detached house).

Management of indoor air quality

The Aereco's MEV system has been designed to optimise the indoor air quality through its smart air inlets and exhaust units that automatically detect the need. For example, during the night, the humidity generated by the occupants in the bedrooms is detected by the air inlets to adapt and increase the airflow, providing good indoor air quality. During the day, the humidity generated by a shower is detected then exhausted by the unit, automatically activated at the highest airflow.

Energy savings on heat losses as on electrical consumption

The smart management of airflows enables to adapt automatically the ventilation to the needs in all rooms, at any time. When the dwelling is low or not occupied, the airflows are automatically reduced in all rooms, preserving the heat in winter and reducing the energy consumption of the fan. According to the conditions, the energy savings on the heating related to ventilation can be estimated between 25% and 50%, and so the electrical consumption of the fan.

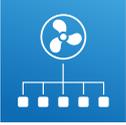

An amazing cost-performance ratio

One of the reason why the Aereco's MEV system has become so popular is its amazing cost-performance ratio. Much more affordable (between 3 to 6 times) than top-of-the-range systems such as, example given, mechanical ventilation with heat recovery (MVHR), this system is a perfect solution in residential applications for those who are looking for efficient and easy to implement solutions. A study realised by the Fraunhofer Institute IBP (Germany) has demonstrated that the efficiency of the Aereco's MEV system is actually close to the one of MVHR, both on the indoor air quality aspect and on the energy side.

Ideal to retrofit and improve the performance of an existing standard MEV installation

This system uses the same ductwork, connexion holes and inlet slots as the ones of standard MEV systems. This means that the replacement of a standard MEV system by the Aereco's MEV system is very simple. The inlets and exhaust units can directly be changed. No wiring is needed at all in general: the humidity sensor of the air inlets and exhaust units is mechanical (no electricity), and the other activation modes for the exhaust units can be either mechanical or on battery.

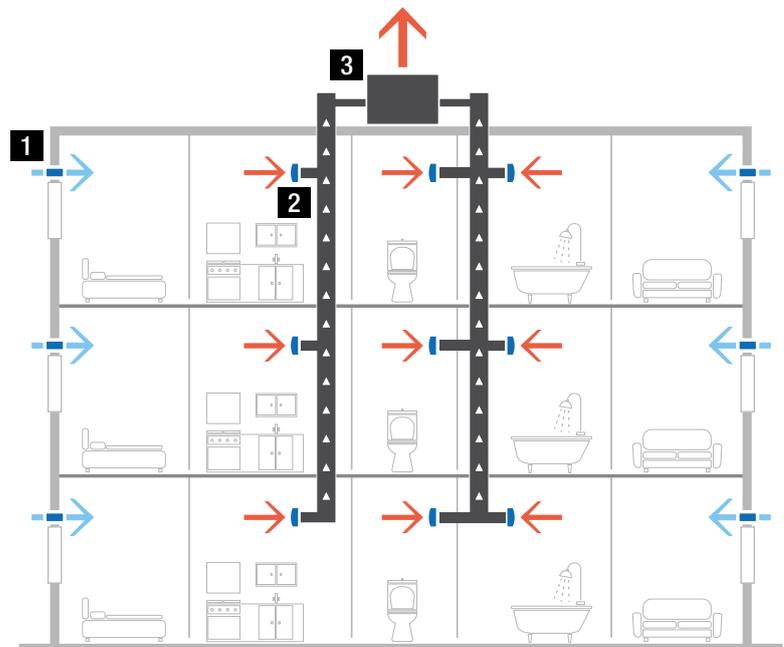

The exhaust fan has just to be changed for a constant pressure one, as proposed in the Aereco range. There is no need to balance the ductwork nor to set the components: the system automatically adapts the airflows.

CONTROLLED MECHANICAL EXHAUST VENTILATION (MEV)

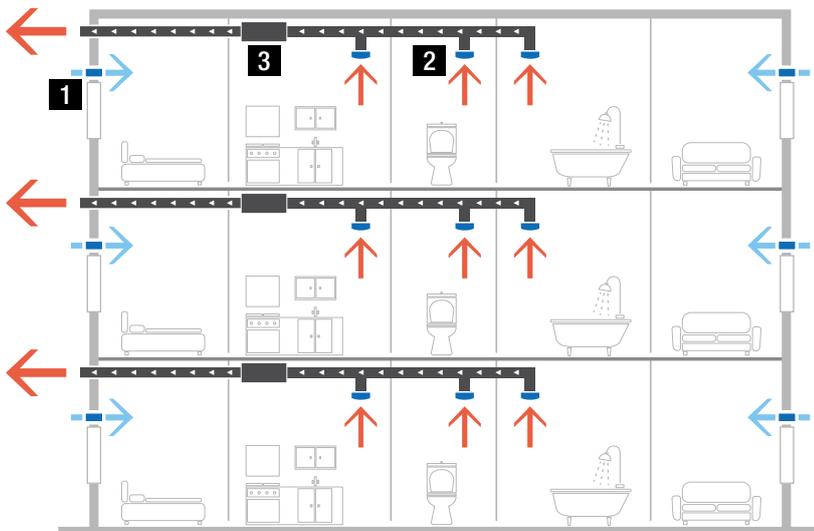

Collective treatment for apartments

In collective mechanical exhaust ventilation, the air in a building is renewed by a fan, installed on the roof or other convenient outside location. In demand controlled ventilation, the air extracted through the exhaust units (2) of the wet rooms determines the air renewal of the entire dwelling. The humidity sensitive air inlets (1) then distribute the new air according to the needs of each main room. The demand controlled exhaust units distribute the airflow generated by the fan (3) according to the needs of each wet room, in each dwelling. Thus rooms, or dwellings, with high new air requirements induce more airflow than empty ones.

CONTROLLED MECHANICAL EXHAUST VENTILATION (MEV)
 Individual treatment for apartments or houses

In this case, the fan is placed inside the dwelling. This treatment is applicable to individual houses as well as apartments. Placing the fan inside the dwelling has the advantage of making it directly accessible, a welcome advantage when it comes to maintenance.

As with collective MEV, the air in the dwelling is renewed by a fan (3). In demand controlled ventilation, the air extracted through the exhaust units (2) of the wet rooms determines the renewal of air in the entire dwelling. Humidity sensitive air inlets (1) then distribute the new air according to the needs of each main room. The demand controlled exhaust units distribute the airflow generated by the fan according to the needs of each wet room. Thus rooms with high new air requirements induce more airflow than empty rooms.

MECHANICAL EXHAUST VENTILATION WITH HEAT RECOVERY (MEVHR)

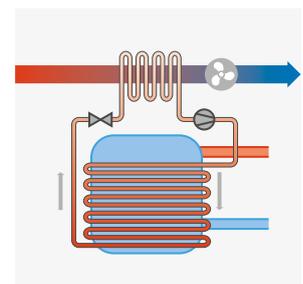

Demand controlled ventilation, even more energy efficient

The MEV system with heat recovery enhances again the energy performance of the Aereco's Mechanical Exhaust Ventilation: by adapting the airflows according to the needs in the dwelling, the Aereco demand controlled system already reduces consequently the heat demand. Through recovering the heat air energy at the level of the exhaust fan, this system drastically reduces the energy load for the air renewal. The AWN fan with heat recovery is connected to a heat pump that can be used for water heating or air heating. The AWN range of fans offers two types of calorigen fluid: water + glycol or refrigerant.

Decreasing the energy load of the heating system

Through this system, an important part of the energy induced by the ventilation can be recovered and then be reused to decrease the energy demand of the energy generating system. In the presence of a heat pump for heat generation, this energy can be directly integrated into the heat source circuit (brine or air). In the case of other heat generators, this energy quantity can be brought from the exhaust air to a temperature level (max. 50°C) by means of an autonomous heat pump.

Thus, for example, the preheating of the hot water is possible or is provided in a buffer store for the heating and / or hot water. In the case of combined use of the ventilation and heat pump technology, a heat exchanger is installed in front of the exhaust fan. The remaining usable energy is extracted from the exhaust air. Intelligent control optimizes the supply and demand of energy from exhaust air and outside air.

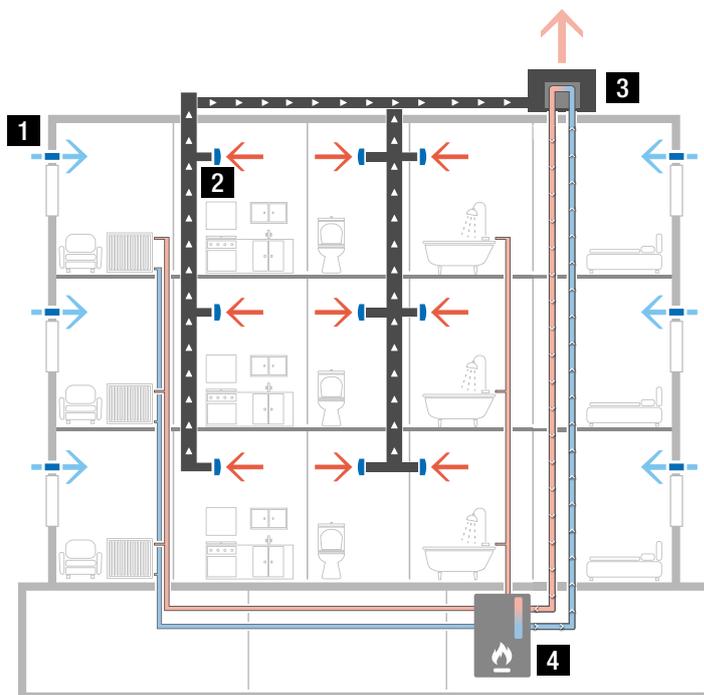

From top to bottom: heat exchanger on the exhaust air (included in the AWN fan), heat pump and hot water storage.

MECHANICAL EXHAUST VENTILATION WITH DEMAND CONTROLLED AIRFLOWS AND HEAT RECOVERY

Collective treatment for apartments

The air in a building is renewed by the fan installed in the roof. The air extracted through the exhaust units (2) of the wet rooms determines the air renewal of the entire dwelling. The humidity sensitive air inlets (1) distribute the new air according to the needs of each main room. The demand controlled exhaust units distribute the airflow generated by the fan (3) according to the needs of each wet room, in each dwelling. Thus rooms, or dwellings, with high new air requirements induce more airflow than empty ones.

With the AWN, the fan (3) includes a heat exchanger that is connected to a heat pump (4) that assists the distribution of domestic hot water in the dwellings, through the recovery of a part of the heat that is contained in the exhausted air.

HYBRID VENTILATION WITH DEMAND CONTROLLED AIRFLOWS

Smart upgrade of the passive stack ventilation

The Aereco's Hybrid Ventilation system is mainly used in residential buildings, with room-by-room demand control of airflows. This system conciliates energy performance and indoor air quality through an affordable solution, easy to implement in refurbishment notably. The Aereco's Hybrid Ventilation system is a perfect solution for upgrading buildings formerly working in passive stack ventilation, through the installation of low pressure assistance fans supplying additional pressure to complement the stack effect.

By proposing a humidity controlled air supply in the dry rooms and a humidity or presence -notably- control of the air exhaust in the wet rooms, this system offers a very smart management of airflows in all rooms.

The Hybrid Ventilation system is dedicated to offices, schools or multi-family buildings. With its very low need for maintenance, it is particularly suitable for social housing associations.

Management of indoor air quality

The Aereco's Hybrid Ventilation system has been designed to optimise indoor air quality through its smart air inlets and exhaust units that automatically detect the need. For example, during the night, the humidity generated by the occupants in the bedrooms is detected by the air inlets to adapt and increase the airflow, ensuring good indoor quality. During the day, the humidity generated by a shower is detected then exhausted by the unit, automatically activated at the highest airflow.

Energy savings on heat losses as on electrical consumption

The smart management of airflows proposed by this system enables to adapt automatically the ventilation to a needs in all rooms, at any time. This means that, when the dwelling has low or no occupancy, airflows are automatically reduced in all rooms, preserving the heat in cold season and reducing the energy consumption of the fan, which is already particularly low (very low pressure working).

No need to reinforce the airtightness of the existing passive stack ventilation ductwork

By keeping the low pressure of the passive stack ventilation (around 5 to 15 Pa at the exhaust grilles), the Aereco's Hybrid Ventilation system can be directly installed on existing PSV ductwork, with no need to measure nor reinforce airtightness.

Ideal to retrofit and improve the performance of an existing standard PSV installation

This system uses the same ductwork, connexion holes and inlet slots as the ones of a standard PSV system. This means that the upgrade of a standard PSV system by the Aereco's Hybrid Ventilation system is very simple. The inlets and exhaust units can directly be replaced. No wiring is needed at all in general: the humidity sensor of the air inlets and exhaust units is mechanical (no electricity), and the other activation modes for the exhaust units can be either mechanical or on battery.

The assistance fans are easily installed at the top of the vertical ducts through adaptation parts. No need to balance the ductwork nor to set the components: the system automatically adapts the airflows.

Low criticality

The assistance fans used in this system have a special patented design to work on both mechanical or passive modes, depending on the thermal or wind conditions. This means that, in case the fan is stopped, it does not create pressure drop, then allows the ventilation to operate in natural mode.

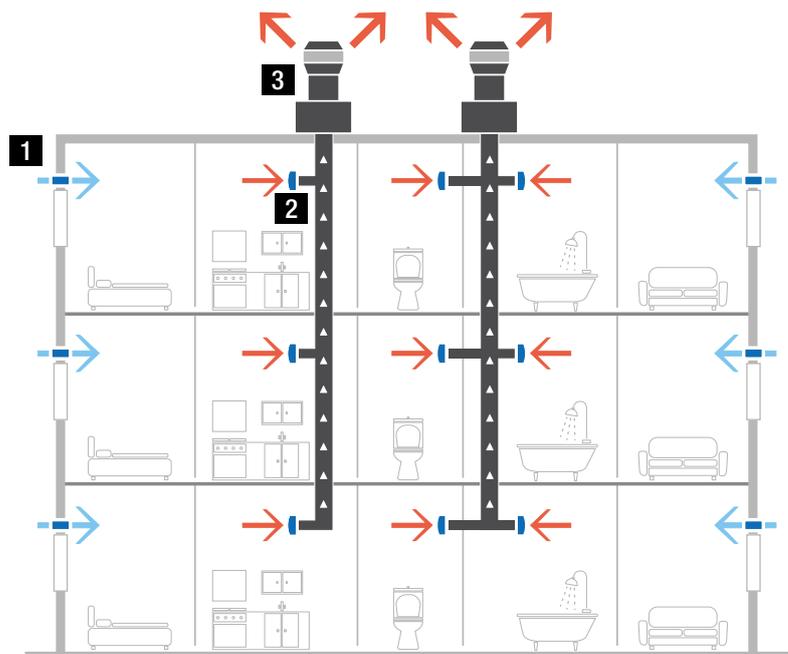

HYBRID VENTILATION

Collective treatment for apartments

A cross between passive stack ventilation and mechanical exhaust ventilation, hybrid ventilation that uses the components and dimensioning of the passive stack ventilation ducts coupled to non-permanent low-pressure mechanical assistance fan (3). The mechanical assistance is used as a complement when the natural forces are not sufficient to ensure the required airflow. It can be managed automatically by a temperature sensor, a timer or even a wind gauge.

The fresh air is admitted by humidity sensitive air inlets (1) in the main rooms (bedrooms and living rooms); the stale air is evacuated through the wet rooms (toilets, bathroom, kitchen) through demand controlled exhaust units (2). These components control the airflows according to the needs of each room.

NATURAL VENTILATION WITH DEMAND CONTROLLED AIRFLOWS

Smart management of thermal draught, better use of pressure

The Aereco's Natural or Passive Stack Ventilation (PSV) system used mainly in residential buildings, with room-by-room demand control of airflows. The Aereco's Natural Ventilation system is a perfect solution for upgrading buildings formerly working in standard passive stack ventilation, by just replacing the inlets and exhaust grilles by smart components.

By proposing a humidity controlled air supply (in the dry rooms) and air exhaust (in the wet rooms), this system offers a very smart management of airflows in all rooms. The humidity controlled exhaust grilles also manage the stack effect, balancing the pressures and airflows along the duct column.

This Aereco's system is especially dedicated to multi-family buildings. With its very low need for maintenance, it is particularly suitable for social housing associations.

Management of indoor air quality

The Aereco's PSV system has been designed to optimise indoor air quality through its smart air inlets and exhaust units that automatically detect humidity. For example, during the night, the humidity generated by the occupants in the bedrooms is detected by the air inlets to adapt and increase the airflow, ensuring good indoor quality. During the day, the humidity generated by a shower is detected then exhausted by the unit, automatically activated at the highest airflow.

Energy savings on heat losses

The smart management of airflows proposed by the Aereco's PSV system enables to adapt automatically the ventilation to the needs in all rooms, at any time. This means that, when the dwelling has low or no occupancy, airflows are automatically reduced in all rooms, preserving the heat in cold season and reducing the energy consumption of the fan.

Ideal to retrofit and improve the performance of an existing standard PSV installation

The Aereco's PSV system is an easy upgrade of a standard PSV system, through the simple replacement of the inlets and exhaust grilles. No wiring, no electricity: the humidity sensor of the air inlets and exhaust units is fully mechanical. No need to balance the ductwork nor to set the components: the system automatically adapts the airflows.

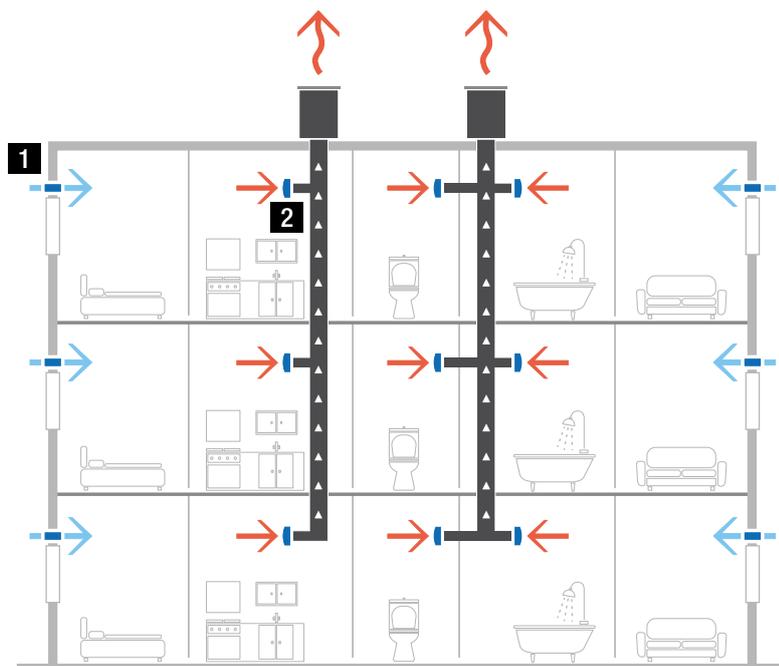

Very low maintenance

Without fan, this system requires very low maintenance, through a simple yearly dusting of the inlets and exhaust grilles.

NATURAL VENTILATION

Individual treatment for apartments or houses

In both individual housing and collective housing, natural ventilation exploits the natural forces (wind and stack effect) to renew the air within the dwellings. These forces create a pressure in the air duct that starts air circulation from the inside of the dwelling towards the air duct and then outside.

The air is exhausted through the wet rooms via exhaust units (2), and this induces an admission of fresh air through air inlets (1) situated in main rooms. Depending upon natural forces (wind and stack effect), the natural ventilation may be random: it is therefore necessary to control it.

The humidity sensitive system, while measuring the humidity rate to drive the necessary airflow, gives an appropriated answer to the variability of the natural forces as it allows to compensate automatically the variation of stack effect, especially in winter.

The pressures available in natural ventilation are from 5 to 15 Pa at the units, depending on building height and climatic conditions.

MECHANICAL VENTILATION WITH HEAT RECOVERY DX SYSTEM

DX System – as flexible as you would need

Through the DX System, a completely new range of heat recovery ventilation system has been designed by Aereco to offer you the maximal flexibility in your choice for the adequate ventilation solution.

The heat recovery ventilation system is the ideal solution for optimum air quality throughout the year while minimizing the energy consumed. This system supply healthy and preheated outdoor air into living areas. Indeed, before being supplied into the housing, the outside air passes through high-performance filters to remove all the particles present on the outside. The air is subsequently extracted into the humid rooms. A heat exchanger, incorporated in the ventilation unit, allows the transfer of calories between fresh air and stale air without impurity transfer. By eliminating the air inlets above the windows, the heat recovery system also guarantees optimum acoustic insulation between the exterior and the interior of the housing.

While most ventilation systems on the market offer constant or globally controlled airflows, DX System stands out as one of the first residential heat recovery ventilation to automatically adjust ventilation according to the specific needs of homes, locally or globally. DX System is dedicated to residential applications and can be either installed in false ceiling, thanks to a small thickness, or in kitchen cupboard, due to optimized dimensions.

By combining the benefits of full demand controlled airflows and heat recovery, which are the pillars of the DynamiX® technology, the DX System, in Excellence version, delivers outstanding energy performance. Modulation enables a significant reduction in average airflows while providing excellent air quality, with heat losses produced by ventilation lowered by half on average in comparison with a constant airflow ventilation. The heat exchanger operates with an efficiency of about 87% recovery (DXR: 82%; DXA: 93%). Combined, these features achieve about 92% (DXR) energy savings when compared with a mechanical exhaust ventilation system at constant airflow, with the same indoor air quality. (1) (2)

A comfortable climate

Heat recovery ventilation DX System continually supplies pollen-free and dust-free fresh air to living areas, ensuring a comfortable feel-good climate. The supply air is preheated by the exhaust air in the very efficient heat exchanger and by the optional preheater.

Best energy efficiency (1,2 and 3)

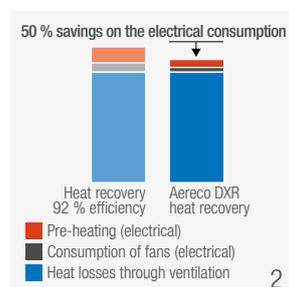

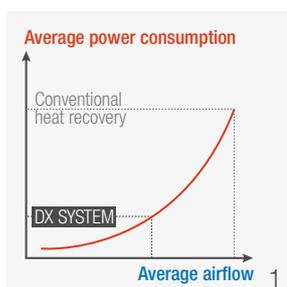

Whether fully room-by-room demand controlled (Excellence version) or partially room-by-room controlled at the supply and room-by-room controlled at the exhaust (Premium version), the DX System optimally uses the exhaust heat to preheat the fresh air and thus offers an energy-efficient solution, whatever the version. Moreover, the demand controlled management enables to decrease significantly the electrical consumption of the system. The best energy-efficiency class A+ is achieved by all the versions of the DX System.

Even in summer, DX ventilation systems are the best choice

As soon as the temperatures rise, the fresh air flows pass through the heat recovery and is directed into the living areas without need for preheating. In cooler summer nights, the fresh air can be used to cool down the heated rooms, by bypassing the heat exchanger.

Easy to maintain (4)

A colour LCD touch screen allows the occupant to view system parameters, to diagnose operation, to control setups such as automatic bypass temperature, to boost ventilation or to action a free cooling on demand. It also notifies the occupant when the filters need to be replaced.

MECHANICAL VENTILATION WITH HEAT RECOVERY

Individual treatment for houses and apartments

DX SYSTEM

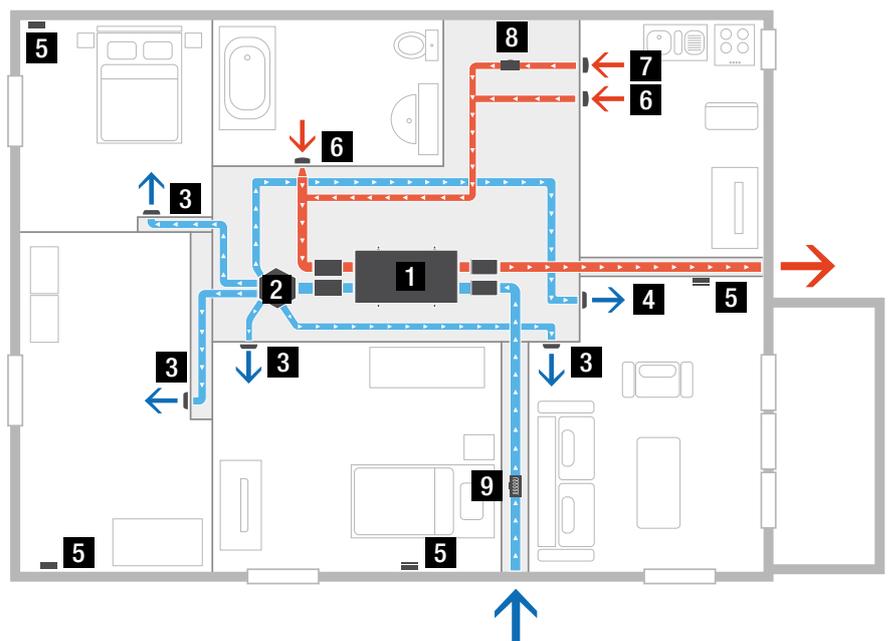

The DX System is comprised of a heat recovery unit (DXA Unit or DXR Unit **1**) connected to exhaust and supply ductworks. The counter-flow heat exchanger, integrated into the main unit, ensures the recovery and transfer of most of the energy from the exhaust air to the supply air, thus limiting the energy required to heat the fresh air.

Airflows are automatically controlled according to the needs of each dwelling's room (room by room DCV): Outdoor filtered air is supplied **3** in the bedrooms and in the living room. Stale air is extracted **6** from the kitchen, bathroom and WC.

On the supply side, depending on the DX System version installed, one or many sensors **5** can adjust the airflow to all main rooms based on the CO₂ level or based on the presence detection.

On the exhaust side, the BXC units adjust automatically the airflow, according to parameters read by various sensors: humidity (used in the kitchen, in the bathroom and in WC), presence (can be used in WC). Versions with switch, presence, remote, CO₂ or VOC sensors can also be used for exhaust units.

At all times, total supply airflows and total exhaust airflows are measured by the heat recovery unit. These airflows are balanced thanks to an exhaust controlled compensation valve **8**. This valve can be located in the bathroom or in the kitchen. In Excellence version only, an additional compensation valve, integrated in the DX Hub **2**, adjusts supply compensation airflow, supplying preheated **9** fresh air in the living room, in the kitchen or in a corridor. Compensation valves are linked to dedicated compensation exhaust unit **7** or dedicated compensation supply unit **4**. The use of an exhaust compensation valve is also a solution to increase considerably the airflows. This scenario is used in order to get a very efficient over-ventilation mode, also called free cooling mode.

To reach the required supply airflows in each main room (bedrooms or living room), dedicated dampers located in the DX Hub **2** modulate room by room supply airflows according to the information sent by each electronic sensors placed in the main rooms. For example, when the main rooms are occupied, the presence or CO₂ sensors that are located in these rooms send the information to the system to adapt the airflow according to the demand. To reach the required exhaust airflows in each technical room (kitchen, bathroom, WC, ...), dampers located in the exhaust units modulate room by room extract airflows according to the passive or active sensor placed within each exhaust unit.

Supply airflows and exhaust airflows are measured by the use of accurate pressure sensors placed in the heat recovery unit. This allows to calculate with a high accuracy supply and exhaust airflows, without influence of clogging filters or ductwork pressure drop. It ensures the highest efficiency for the system. So that, energy savings are at their maximum.

DX System components:

			Premium version	Excellence version
1	 <p>DXR DXA</p>	<p>DX Unit Heat recovery unit with balanced demand controlled airflows</p>	x1 (DXR or DXA)	x1 (DXR or DXA)
2	 <p>HUB 5 HUB 6</p>	<p>DX Hub Distribution box for demand controlled supply airflows</p>	-	x1 (DX Hub 5 or 6)
3		<p>SDC 100 Supply unit</p>	x1 to x6	x1 to x6
4		<p>SDC 125 Supply unit for balance</p>	-	x1
5		<p>S-CO2 CO₂ sensor</p>	at least x1 (S-CO2 or S-PRE)	x1 to x5 (S-CO2 or S-PRE)
5		<p>S-PRE Presence sensor</p>		
6		<p>BXC Exhaust unit with integrated humidity, presence detection or other sensors</p>	x1 to x5	x1 to x5
7		<p>BXC b Exhaust unit for balance</p>	x1	x1
8		<p>Motorized valves Exhaust compensation valve</p>	x1	x1
9		<p>Preheater Galvanised steel body with built-in resistance</p>	x1 (optional)	x1 (optional)
		<p>Touch screen Display and control module for the user also used for maintenance</p>	x1	x1

Note: some other components may be used in the system such as condensation exhaust pump, acoustic silencers, etc.

DEMAND CONTROLLED VENTILATION FOR NON-RESIDENTIAL BUILDINGS VMX SYSTEM

VMX, a demand controlled ventilation system for non-residential buildings

The VMX is a unique intelligent ventilation system for non-residential sector (restaurants, schools, offices, meeting rooms...). This system is easy to install both in the new built and the refurbishment buildings. The VMX automatically modulates the ventilation on the basis of information received from the detectors that measure CO₂ concentration, movements or detect presence. Thus, the air supply and exhaust flow rates are then matched to the true needs of the rooms functioned of the occupancy, reducing thermal losses and optimising electrical fan consumption. The VMX system is an affordable solution conciliating energy performance, indoor air quality and acoustic comfort that enhances rooms' occupant comfort.

VMX, a smart ventilation system

Premises in non-residential buildings are characterized by highly variable and intermittent occupancy. For example, meeting rooms are generally used for a few hours and their occupancy is quite variable. Classrooms are completely empty during recreation periods, lunch breaks and vacation periods. The VMX, with its smart ventilation, is well suited for the tertiary sector and allows an optimal management of ventilation flow rates according to the occupancy of the room.

Important energy savings

This system yields large energy savings by reducing airflow rates by 25 to 75%, on average, depending on the reference flow rates. Thanks to carbon dioxide or presence detectors placed at different locations in the room, the flow rates are managed strictly according to the needs. This avoids both over-ventilation, which would mean higher energy consumption, and under-ventilation, which could have negative impacts on the health, concentration, and comfort of the occupants.

from **25 %**
to **75 %**
energy savings

Management of indoor air quality

With its different sensors, the VMX optimises indoor air quality by adapting automatically its ventilation to the needs of the room. If, for example, a room is highly occupied, the indoor air will be charged with CO₂, humidity and odours emitted by the occupants which can result not only in discomfort and inconvenience but also in decrease of concentration. The VMX system, thanks to its sensors, will detect the occupancy rate and instantaneously activate the ventilation evacuating vicious air, bad odours and allowing new fresh air in the room.

Three detection modes

VMX system offers the possibility to measure three types of information through three detection modes: the "Presence" mode, which adapts the ventilation according to the detected presence. The "Movement" mode, which induces a ventilation rate proportional to the number of movements measured. The "CO₂" mode, which adjusts the airflow proportionally or binary (minimum / maximum) to the CO₂ rate.

VMX SYSTEM

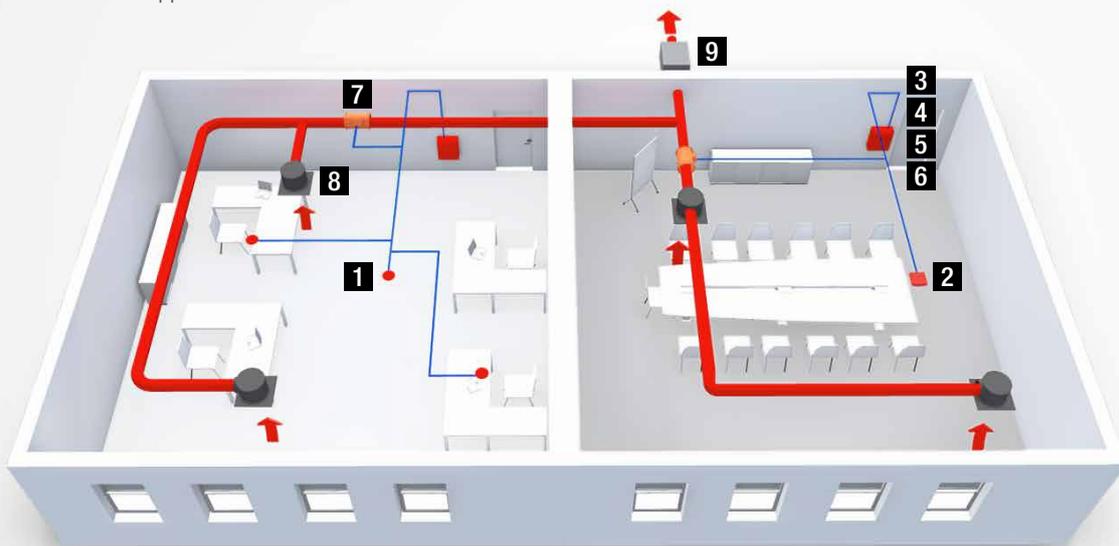

DEMAND CONTROLLED VENTILATION FOR NON RESIDENTIAL BUILDINGS

An open and functional system

The VMX system is an intelligent system which can be fully configured according to needs thanks to its several components (see next page). These elements can be adapted to most types of equipment commonly used for ventilation. They can also communicate with the majority of external systems (to provide information or to comply with instructions).

The VMX system can fit the existing ventilation network and has 2 ways of managing ventilation: “Unizone” or “Multizone” approach.

Example of a Multizone application

In a Unizone installation, the VMX system manages and controls the ventilation flow rates centrally, at the fan. This generally assumes that one fan is installed for each room. The detector in the room measures a parameter (CO_2 , presence, movement, etc.) and sends a signal to the modules that control the fan to vary the airflow rate and thereby ensure optimal indoor air quality.

In a Multizone installation, the VMX system manages and controls the ventilation flow rates in a decentralized manner, on the motorized valves. Several valves and diffusers are connected to a single fan, which can serve one or several rooms. A single fan serves several air supply or exhaust valves and diffusers, located in a single room or in different rooms. There is generally one VMX system (one MAIN module) per room. The detector(s) placed in the room measure(s) various parameters (concentration of CO_2 , presence, movement, etc.) and send signals to the modules that control the motorized valves (opening or closing of the flaps in a specified time) so as to adapt the airflow rates and thereby improve the indoor air quality.

VMX System components:

1		<p>S-PRE* Optical sensor for the VMX system. It measures presence or motion.</p>
2		<p>S-CO2* Carbon dioxide sensor for the VMX system.</p>
3		<p>Main Module** Main module for the VMX system.</p>
4		<p>CONTACT IN module* Optional module for the VMX system. External instructions input.</p>
5		<p>IN/OUT 0-10V module* Optional module for the VMX system. System status Output and/or external instructions Input.</p>
6		<p>RELAY OUT module* Optional module for the VMX system. System status output.</p>
7		<p>Motorized valve (multizone only) Exhaust compensation valve.</p>
8		<p>Diffuser(s) Helical jet input or output airflow TROX XARTO diffuser. Airflow 324 to 990 m³/h. Exists in different designs, with a round or square facing. On special request only.</p>
9		<p>Fan Aereco fan VCZ model.</p>

*optional **mandatory

PRODUCTS

General remark concerning the codes mentioned in the document

These concern the standard product, i.e. without options or accessories. In general, they concern the white version, for the product delivered alone (not as part of a kit). Other codes are possible for other versions of the products. Please contact Aereco for the full list.

Installation data are recommendations for optimal use of our products.

NEW

EMM²

Humidity sensitive air inlet for windows

Slim design: only 31 mm thickness.

Humidity sensitive system: modulates the airflow according to the local relative humidity.

Directional airflow (horizontal) as accessory.

Manual closing and opening device in option.

Additional airflow sleeve available as an accessory.

Slim profile for easy installation on windows.

Easy to maintain: no adjustment, simple yearly dusting.

Slim design for perfect integration

With its slim design (only 31 mm thickness), the EMM² is optimised to discreetly integrate on all types of windows. Its humidity sensitive sensor modulates the airflow according to the ambient humidity level. The EMM² has specific accessories to increase the airflow or to adapt the air direction if necessary. The range is composed of 2 humidity sensitive versions and 4 different colors; its single-part front cover facilitates painting. Installed with a specific canopy, it provides an acoustic attenuation of 37 dB.

Directional airflow (1)

The standard version offers an oblique airflow, which can be modified with the accessory O-EMM² to adjust the air jet horizontally in case of close proximity of windows reveals or ceilings. Therefore, the airjet is always optimal and the airflow guaranteed.

Additional airflow sleeve (2)

The E-EMM² sleeve, available as an accessory, enables an increase in airflows for the different versions of the EMM² to satisfy regulatory requirements or to decrease the number of air inlets in some rooms.

A manual closing and opening device (3)

This option, available on the 5-35 humidity sensitive version, allows you to choose between 3 modes: minimum, automatic (humidity sensitive) or maximum to adapt the airflow to the occupant's needs.

EHA²

Acoustic humidity sensitive air inlet for windows

Humidity sensitive system: modulates the airflow according to the local relative humidity rate.

Acoustic attenuation up to 42 dB with accessories.

Optional closing and opening device.

Slim profile for easy adaptation on windows.

Easy to maintain: no adjustment, simple yearly-dusting.

Stylish design, with maximum functions

The stylish design of the EHA² inlet enables perfect integration on most windows or rolling shutter casings. With the inclusion of high efficiency acoustic foam the product reaches an acoustic attenuation up to 42 dB when mounted with the special base and canopy. An optional device allows on demand manually closing or opening of the air inlet, complementing the humidity sensitive function available on the EHA².

Oblique air jet for occupant comfort (1)

The oblique air jet of the EHA² skims the ceiling ensuring progressive heating of fresh air for the improved comfort of the occupants.

Optional opening and closing device (2)

This device is available on versions 5-35 (humidity sensitive) and 35 (without humidity control); it enables the occupant to choose between three modes: minimum, automatic (humidity sensitive) or maximum airflow. The device can be added after the product is installed.

Efficient protection against external noise (3)

When installed on its acoustic base and with acoustic external canopy (A-EHA), the EHA² air inlet offers great acoustic attenuation, up to 42 dB at maximum opening, which makes it one of the best products available on the market with an air cross section this size (3600 mm²).

EAH²

Humidity sensitive air inlet for rolling shutter casings

Specially designed for rolling shutter casings.

Humidity sensitive system: modulates the airflow according to the local relative humidity rate.

Optional closing and opening device.

Vertical air jet for the comfort of the occupant.

Air admission hole and shutter not visible from the occupant.

Easy to maintain: no adjustment, simple yearly-dusting.

Easy to install, no visible screws.

Flat design for perfect integration

With its flat design and its special airtightness sleeve, the EAH² air inlet is perfectly fitted to equip rolling shutter casings. The air is admitted in the room through the top of the product, the hole and shutter are not visible for the occupant. Its mechanical sensor modulates the airflow according to the local humidity, automatically and without electricity. An optional closing and opening device is available to manually fix the airflow to the minimum or maximum, if requested. A patented* specific sleeve is proposed as accessory to increase the airflows of the standard versions.

Aesthetic integration (1)

The flat and compact design of the EAH² and its non-visible top shutter favors its aesthetic integration, especially when mounted on rolling shutter casings. Its single frame front cover makes the painting easy to adapt to colored casings or windows.

Improved airtightness through efficient accessories (2) (3)

A common issue with rolling shutter casings, notably when in PVC, is that the slot drilled on its façade for ventilation generates lateral leakages through the cells. To avoid this issue we have developed a specific sleeve, the T-EAH², that ensures the continuity between the inner part of the shutter casing and the air inlet, optimizing the acoustic and aeraulics performance (2). A back seal (S-EAH²) is also proposed to adapt to specific shape of rolling shutter casing (light curve, unflat façade, etc.) (3). This accessory is stuck at the back of the air inlet (self-adhesive seal).

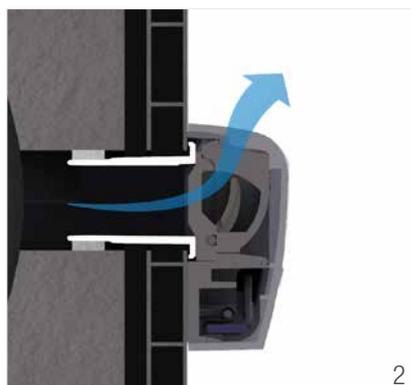

Rolling shutter casings, but not only

Although first dedicated to rolling shutter casings, the EAH² can also equip windows with large top frames or transom windows.

EHT²

Wall humidity sensitive air inlet

Humidity sensitive system: modulates the airflow according to the local relative humidity.

Core drilling: easy installation on the wall, ideal for refurbishment projects.

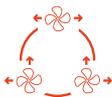

Acoustic attenuation up to 52 db with accessories.

Closing and opening device.

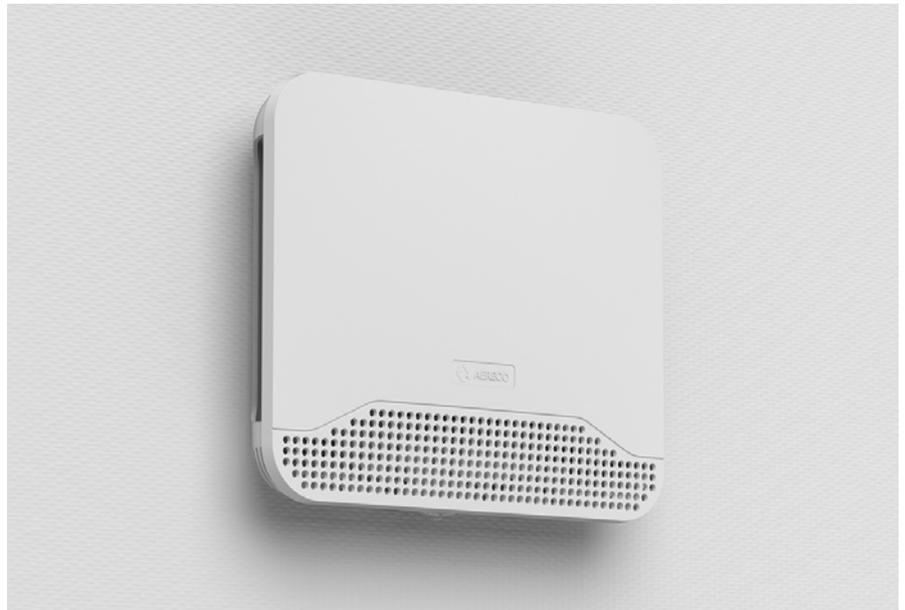

Long-lasting material : doesn't alter with time.

Airflow orientation choice : movable deflectors.

Easy to maintain: no adjustment, simple yearly dusting, and readily accessible filters.

Consistency of aeraulic and acoustic performance

The EHT² is the new generation of humidity sensitive wall air inlet. Installed on the wall (100 mm or 125 mm), the humidity sensitive air inlet EHT² is an ideal alternative to window air inlets, offering an answer in case of lack of space on the windows. With accessories, it provides a high level of acoustic insulation, up to 52 dB, which places it among the best performing products on the market. The EHT² also has a multimodal dial where the closed mode allows protection from cold and strong wind. Are available as well the wide open and the humidity sensitive modes

Flexibility for comfort (1)

The EHT² has three possible openings for incoming air: two side openings and an opening above the device. By offering the choice of assembly according to the configuration of the room, the EHT² gives more possibility of wall installation. The EHT² can therefore be installed close to the walls without the risk of damaging them or bothering the residents because of the incoming air.

Clever insect filters (2)

Clean the insect filter? It's easy: the EHT² rotates and provides access to two types of removable filter. The F-EHT is easily accessible directly from the duct and the EHT² grid is even simpler from the base of the air inlet!

The rain canopy (3)

The rain canopy has a protective parable that blocks raindrops, even in the most extreme conditions. Thanks to this canopy, almost zero infiltration. Aereco wanted to accompany its innovations on the EHT² with a new design, clean and in tune with the times. Indeed, the EHT² fits perfectly into the interior home by appearing space-saving and thin.

EXTERNAL CANOPIES

Protects the internal structure of the window against water infiltration.

Protects the dwelling from flying insects.

Ensures the aesthetic balance of frontage and windows.

Helps protect against noise (acoustic canopies).

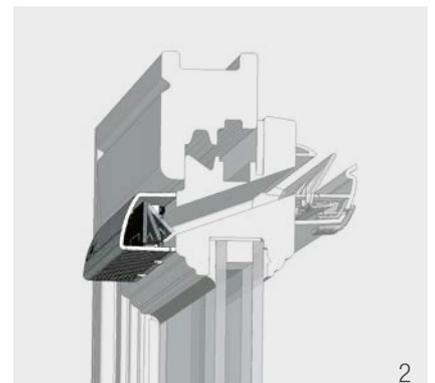

Aereco canopies: attractive, easy-to-install protection

External air inlet canopies protect the elements of the frame (windows, casings) hosting the air passage holes against bad weather and water infiltration. Their role is also aesthetic: they blend in perfectly with the frontage and windows. They can also perform such functions as soundproofing, insect protection, etc.

Patented design to control the maximum airflow on the AC canopy (1, 2)

The AC external canopy is designed to automatically limit the airflow in the event of high pressure, thanks to a patented device. The mechanism comprises a silicon flap that moves according to the airflow. It automatically reduces the air cross-section when the airflow becomes too high.

E-TFR

Window telescopic sleeve

Avoids the internal cooling of the window (protects from condensations).

Keeps the thermal performance of the window.

Optimizes the acoustics of the air inlet (no noise leakage).

Ensures the air section needed.

Adapts to the thickness of the window.

Aesthetic integration: designed for Aereco air inlets.

Easy installation: fixing through the holes of Aereco air inlets and canopies.

Protection of the window and guarantee of airflows

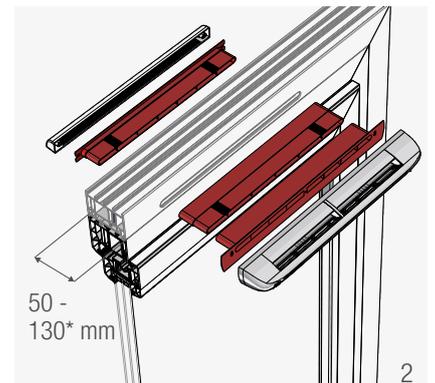

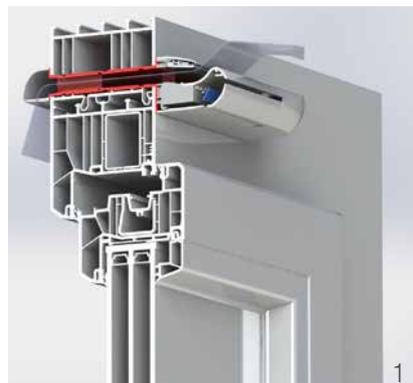

By ensuring the continuity of the airflow from the outside canopy to the air inlet, the E-TFR protects the interior of the window and avoids cooling to prevent internal condensation. Its implementation guarantees sufficient air passage for ventilation of the room. The window sleeve is composed of two interlocking parts (a canopy side and an air inlet side) plus an optional extension to cover a wide range of window thicknesses, from 50 to 130 mm. 3 versions are available to fit perfectly to the different Aereco air inlets to ensure a perfect airtightness and aesthetic finish (EMM / EHA version, EMM² and EHA² version).

Avoids the internal cooling of the window (1)

By ensuring the continuity of the flow from the outside canopy up to the indoor air inlet, the window telescopic sleeve E-TFR prevents the cooling of the window inner frame. It thus reduces the risk of condensation inside and keeps the thermal performance of the window, notably for aluminium windows.

Adapts to most of the window profiles, as thin as thick (2)

With two interlocking parts and a telescopic extension available as an accessory, the E-TFR adapts to window profiles from 50 to 130 mm thickness. Included clips also allow to ensure the correct connection of the components within the profile.

G2H

Multi-controlled exhaust unit for natural and hybrid ventilation

Fully automatic operation: exhaust airflow according to various parameters, such as humidity or presence.

Pull cord, switch, and remote auxiliary airflow control versions.

Indoor air quality and energy saving thanks to automatic airflow control.

Large air cross-section optimised for natural ventilation or hybrid ventilation, in new buildings or renovations.

Fits directly on all types of air ducts (collective or individual, concrete or metal "shunts").

Completely silent operation.

A unique solution precisely optimised for natural and hybrid ventilation

The G2H is the first exhaust unit precisely optimised for natural (passive stack) and hybrid ventilation, in both new buildings and renovations. By providing both automatic control of the airflow according to needs and auxiliary airflows (manual or automatic), the G2H exhaust unit advantageously combines energy efficiency and indoor air quality. It offers a very large air cross-section to ensure the airflow even at a very low pressure, from 2 Pa. It is particularly easy to install, since it fits perfectly on collective or individual ducts designed for natural or hybrid ventilation.

A smart and unique exhaust unit

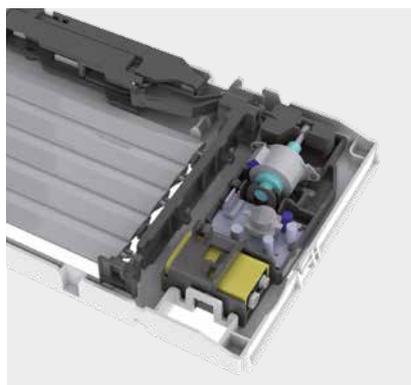

The numerous modules available on the G2H exhaust unit meet various needs and occupancy modes in dwellings: humidity controlled to remove excess moisture quickly, presence detection, and even remote control to exhaust odours are some of the actuation modes available to optimise, at all times and in every room, both indoor air quality and energy consumption.

An optimised solution to improve building energy performance

With settings precisely optimised, the G2H exhaust unit is an especially satisfying response to anyone wishing to combine energy efficiency, quiet operation, and ease of implementation, whether in a new or a renovated building.

A very large air cross-section to accommodate low pressures

With an air cross-section of up to 163 cm² at maximum opening, the G2H exhaust unit ensures airflows even at very low pressure, from 2 Pa.

GHN

Humidity sensitive exhaust unit for natural and hybrid ventilation

Humidity sensitive system: modulates the airflow according to the local relative humidity.

Easy to install: directly replace the old ventilation exhaust units, without modification of the hole.

Easy to maintain: no adjustment, simple yearly dusting.

Naturally effective extraction

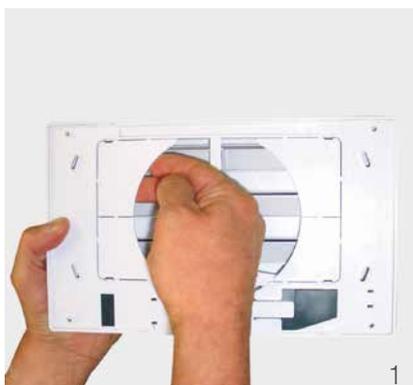

How can wet rooms be effectively ventilated with allowance for the requirements and specific needs of natural (passive stack) ventilation? The GHN humidity sensitive exhaust unit is the perfect solution, as it adapts its airflow to variations in relative humidity. Its dimensions are compatible with the air cross-section of natural ventilation ducts and its design allows for perfect integration in bathroom and toilets.

Suited to all situations (1)

Four removable plates on the back of the GHN make it adaptable to different dimensions and hole configurations when installed in a bracket version. It is also possible to increase the maximum airflow up to 100 m³/h for a pressure of 10 Pa.

Simple mechanism for greater longevity (2)

The GHN has a simple and robust humidity sensor that requires no maintenance and will retain all of its qualities for many years.

BXC²

Demand controlled exhaust unit for MEV

Humidity sensitive, presence detector and switch versions: modulates the airflow according to the various needs of the dwelling.

Airflow '+': possibility of setting the airflow levels at installation: up to + 50 m³/h on the max. airflow.

Advanced special versions: CO₂, VOC, and remote control versions.

Silent working: silent auxiliary airflow activation.

Battery indicator: buzzer to indicate low battery level.

Pressure plug: allows pressure measurement to determine the airflow.

Easy to maintain: removable shutter case and front cover for easy cleaning.

A multifunctional exhaust unit to optimise indoor air quality and energy efficiency in MEV applications

The BXC² incorporates all of the functions one could want in an air exhaust unit: various activation modes, such as humidity sensitive, presence detection, switch, and even CO₂ are available to adapt the ventilation to occupants' needs. The exhaust airflow is automatically modulated, in silent operation. The range of variable airflows can be set at installation to meet special needs, or to compensate for a lack of pressure; commissioning is also facilitated by the presence of a pressure plug, which allows measurement and easy calculation of the airflow.

Airflow '+': airflow can be set at time of installation (1)

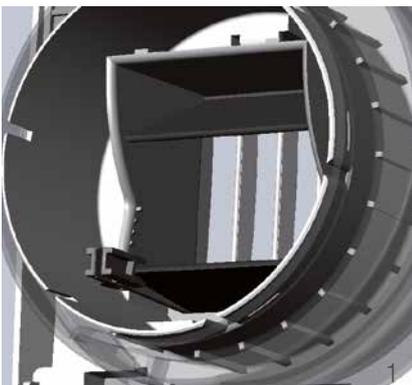

The BXC² lets you set the airflow according to the pressure available or to specific regulation requirements. The fixed shutter can be set to 6 positions, with an average step of +10 m³/h (maximum = +50 m³/h).

Pressure plug to help commissioning (2)

The built-in pressure plug makes it easy to measure the pressure using a manometer, then calculate airflow using a table in the installation instructions.

Advanced special versions (3)

The BXC was the first exhaust unit in the world offering the possibility of having built-in CO₂ and VOC sensors, for example. In keeping the same innovations the BXC² is especially well suited to applications in schools, offices, gymnasiums, mobile homes, etc. A remote control version is also available.

BXC-EG

Flush-mounted demand controlled exhaust unit for MEV

Flush-mounted exhaust unit :
discreet and non-intrusive.

Humidity sensitive, presence
detector and switch versions:
modulates the airflow according
to the various needs of the
dwelling.

Advanced special versions: CO₂,
VOC, and remote control versions.

Silent working: silent auxiliary
airflow activation.

Battery indicator: buzzer to
indicate low battery level.

Easy to maintain: removable
shutter case and front cover for
easy cleaning.

A flush-mounted multifunctional exhaust unit to optimise indoor air quality and energy efficiency in MEV applications

As part of the BXC product family, the BXC-EG incorporates all of the functions one could want in an air exhaust unit: various additional airflow activation modes to adapt the ventilation to occupants' needs (presence detection, switch, remote control...), as well as the humidity sensitive technology that allows to modulate the exhaust airflow automatically, with silent operation. Flat and flush-mounted, the BXC-EG is very discreet and non-intrusive. Its installation is easy and flexible since it can be fixed not only to the wall or flush-mounted in a partition but also to the ceiling.

Airflow '+' (1)

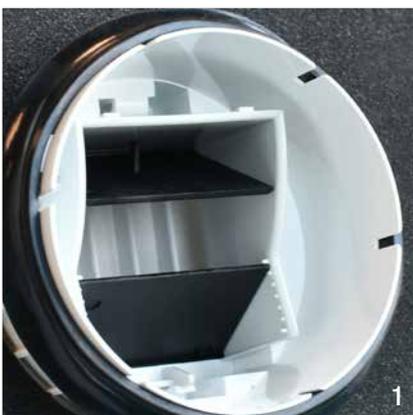

Airflow can be set at time of installation to meet specific needs, or to compensate for a lack of pressure. The fixed shutter can be set to 6 positions, with an average step of +10 m³/h (maximum = +50 m³/h). It allows the airflow to be adjusted according to the available pressure or specific requirements.

Pressure plug to help commissioning (2)

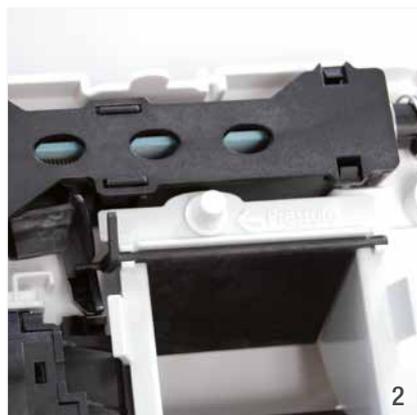

The built-in pressure plug makes it easy to measure the pressure using a manometer, then calculate airflow using a table in the installation instructions.

Advanced special versions (3)

The BXC was the first exhaust unit in the world offering the possibility of having built-in CO₂ and VOC sensors, for example. In keeping the same innovations, the BXC-EG is especially well suited to applications in schools, offices, gymnasiums etc.

GBP

Humidity sensitive exhaust unit
for natural and hybrid ventilation

Humidity controlled or pull cord
activated airflow.

Low-pressure solution optimised
for energy performance, with many
versions available for different
types of housing and rooms.

Completely silent operation.

Suitable for individual or
collective natural ventilation
ducts using an adapter plate.

Easy cleaning: removable shutter
box and front cover.

The ideal solution to refurbish ventilation while keeping low-pressure operation

Specially adapted to work at low pressure, the GBP humidity sensitive exhaust unit is an ideal solution for the renovation of ventilation ductwork initially operating in natural ventilation. The GBP exhaust unit is available in several versions activated by a humidity sensitive sensor or by a pull cord, for implementation on collective or individual air ducts. Operating at pressures from about 15 to 30 Pa, it can be connected to a low-pressure exhaust fan or to a hybrid fan (VBP, VBP+). In addition to making it unnecessary to measure duct air-tightness, low-pressure operation offers the advantage of consuming considerably less energy than conventional mechanical exhaust ventilation, with quiet operation.

The ideal way to refurbish with low-pressure ventilation

The GBP exhaust unit is available in several versions, with airflow controlled by a fully automatic humidity sensor or by pull cord. Constant airflow versions are also available.

Easy to adapt to individual or collective natural ventilation ducts

Thanks to an adapter plate available as an accessory, the GBP exhaust unit fits easily over the holes of old ventilation exhaust units.

TDA

Exhaust unit with presence detection for MEV

Presence detection: starts the basic airflow as soon as a presence is detected.

Easy to maintain: removable grille for easy cleaning.

Easy adjustment of the basic airflow according to the number of occupants.

Battery (9 V) or 12 VAC supply.

Output to relay (specific version) to operate external device (light, etc.) upon presence detection.

Detecting presence to adapt the airflow

TDA exhaust units directly adapt the exhaust airflow to the presence detected in the room. A simple initial adjustment of the basic airflow according to the usual number of occupants is sufficient to ensure permanent air quality. When the room is unoccupied, the airflow is automatically reduced, allowing savings averaging 50% on thermal losses due to ventilation.

Precise detection of presence (1)

The presence detection module comprises a pyroelectric sensor that detects infrared radiation focused by a Fresnel lens. With a 4-meter range and a 100° angle of detection, this is very effective. The infrared radiation focused on the sensor is continually analysed; when a variation is perceived, a signal is sent to the electronic board, which analyses it and then activates the motor controlling the opening of the exhaust unit shutters. The detection module can discriminate between human heat and heaters or lights. The “basic” airflow is started as soon as a presence is detected: the TDA returns to the reduced airflow 20 minutes after the last detection. When the room is empty, this saves up to 50% heating energy (compared to constant ventilation with the same air quality).

A simple adjustment determines the basic airflow (2)

A cursor can be used at any time to set the number of people in the office, which determines the basic airflow activated by the detection process (from 25 to 100 m³/h).

Output to relay

A specific version has an output to operate a relay (6 VDC, I_{max}. 100 mA), which can be used to activate an external device such as the light, for example.

V2A

Acoustic whole-house fan – 2 rooms

Silent: only 33 dB(A)*.

Low energy consumption: only 5.5 W @ 40 m³/h.

Constant pressure: fitted to demand controlled exhaust units.

Easy to install: flat and compact, directly installed in inhabited space.

12 VAC output to supply electrical exhaust units.

Outlet 100 mm in diameter.
Inlets 80 mm.

Easy to maintain: simple yearly cleaning of a filter, easily accessible without tools.

Discretion and comfort in sanitary installations

The best ventilation is ventilation nobody notices. You will not notice the V2A fan: quiet, easily hidden in a wall cupboard or in the loft space. You will simply appreciate the quality of the air renewal. Installed in apartments or in individual houses, the V2A can connect up to two demand controlled exhaust units located in bathrooms and toilets. As far as consumption is concerned, it is as energy-efficient as it is discreet with its low-consumption EC-motor.

An intelligent EC-motor

The speed of the EC-Motor (Electronic Commutation Motor) of the V2A is controlled by an electronic board. The motor speed, associated with a special wheel, holds the pressure at 80 Pa to keep the airflow proportional to the variable cross section of the two connected demand controlled exhaust units. This keeps power consumption and noise emissions to a minimum.

Installed close to the occupant

Because it is silent and compact, the V2A can be installed directly in the living space, in a wall cupboard, a loft volume, etc. Maintenance is facilitated by its proximity to the occupant, and also by the removable filter, easily reached by opening the lid, with no need of a tool.

12 VAC output for exhaust units with electrical boost airflow

The V2A fan includes a 12 VAC transformer to supply up to two exhaust units equipped with an electrically activated airflow.

V4A PREMIUM

Acoustic whole-house fan – 4 rooms

Silent: only 33 dB(A)*.

Low energy consumption: less than 13 W*.

Constant pressure: fitted to demand controlled exhaust units.

Easy to install: flat and compact, directly installed in living space.

Outlet 125 mm in diameter.
Inlets 100 or 125 mm.

Easy to maintain: simple yearly cleaning of the removable impeller, accessible without tools.

Silent operation and efficient ventilation of the whole dwelling

The V4A Premium fan is designed to ventilate a complete dwelling, with up to four exhaust units located in the kitchen, in the toilets, and in the bathrooms. Easily hidden in a wall cupboard or in a false ceiling, the V4A Premium will provide all the comfort and air quality you want. It uses an optimised EC-motor, and the electrical part is removable to facilitate maintenance.

An efficient motor

The speed of the V4A's EC-Motor (Electronic Commutation Motor) is controlled by an electronic card. The motor speed, associated with a special wheel, holds the pressure at 100 Pa to keep the airflow proportional to the variable cross-section of the connected demand controlled exhaust units. This keeps power consumption and noise emissions to a minimum.

Optimised for silence (1, 2)

The high efficiency EC-Motor is mounted on flexible links and is encased in a double-skin envelope: the V4A is totally optimised to work silently, allowing installation inside the dwelling.

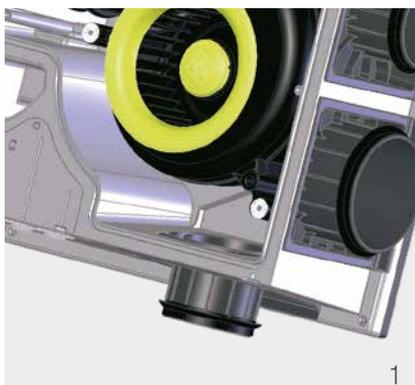

User-friendly maintenance

Maintenance is simple because the fan is inside the dwelling: the cover is simply lifted off and the impeller is easy to remove thanks to a patented attachment system. And the electrical part is removable, so the motor can be replaced without removing the fan from its support.

12 VAC output for electrical exhaust units

The V4A fan integrates a 12 VAC transformer to supply up to four electrical exhaust units.

*@ 40 m³/h

V5S

Whole-house fan – 5/6 rooms

Low energy consumption:
only 10 W*.

Constant pressure: fitted to
demand controlled exhaust units.

Robust design.

Reliable and efficient motor,
made in Germany.

Easy installation: flat and
compact, directly installed in
living space.

Robust, efficient, and affordable fan

The V5S fan can ventilate a complete dwelling: the 6 available side inlets can be connected to several exhaust units in the wet rooms. With its constant pressure, the fan is well suited to demand controlled exhaust units. The V5S completes the existing line of Aereco fans for individual treatment (the V2A, V4A, and VAM), with comparable features such as a flat design (for installation in a cupboard or in a false ceiling), robust construction, and ease of maintenance thanks to a removable cover. In addition, its large box optimises its aeraulic performance and the energy consumption of the motor. It can be installed in the wet rooms, or in an insulated attic, on the floor, on the ceiling, or on the wall. The V5S exists in two versions: with an EC-motor (V5S "Premium" - pict. 1) or an asynchronous motor (V5S "Reference" - pict. 2 and 3).

Optimised for demand controlled ventilation

Thanks to the specific design of the impeller and coil set, the pressure is kept constant to allow airflow modulation when connected to demand controlled exhaust units.

Robust and reliable for long life

The motor, made in Germany by a leading manufacturer, and the robust design (plastic box reinforced by strong ribs) of the V5S guarantee the durability and reliability of the product, which benefits from Aereco's long experience in ventilation.

VAM

Acoustic whole-house fan – 6 rooms

Silent: only 29 dB (A)*.

Low energy consumption: only 23 W*.

Constant pressure: fitted to demand controlled exhaust units.

Easy to install: easy to handle and can be directly installed in living space (in a wall cupboard, corridor, etc.).

Choice of 3 settings at the time of installation: 80, 100 and 120 Pa.

Outlet 125 mm in diameter
Inlets 100 or 125 mm.

High capacity and low consumption

Thanks to its slim styling and silent running, the VAM fan is ideal for installation in living spaces. With its powerful AC motor and its optimised design, the VAM can be connected to up to six exhaust units in the same dwelling. Its airflow characteristics (constant-pressure curve) are well suited to operation with demand controlled exhaust units.

Intelligent motor

The VAM is driven by a single-phase asynchronous motor the speed of which is held constant by a tachometer and an electronic board, whatever the airflow required by the exhaust units*. The power is adjusted and optimised to limit noise and energy consumption.

3 pressures available

The VAM provides a choice of three pressure levels at the time of installation: 80, 100, or 120 Pa. This feature can be used to satisfy specific regulations or to compensate for complex ductwork.

Installation close to the occupant

Because the VAM is silent (acoustic foam) and compact, it is easy to install directly in the living space of the dwelling, in a wall cupboard, a loft space, etc. Maintenance is facilitated by its location within the dwelling.

VTZ Smart

Collective fans for outdoor installation

Low energy consumption: Electronic Commutation motor associated with an automatic pressure control device.

Solidity and reliability: metal design, made in Germany.

DCV compatible: integrated automatic pressure control device, optimizing the DCV performance.

Silent: acoustic foam on the entire envelope and sound trap available on request, optional.

Easy to install: many available adaptation parts, possibility of custom-built construction.

Easy to maintain (1): easy cleaning of blades after swinging the fan.

Solidity and performance for collective outdoor installations

The VTZ Smart fans range offers several models with capacities going from 345 m³/h up to 6800 m³/h for the equipment of collective dwellings, offices, schools or other buildings. The VTZ Smart fans are designed for an outdoor installation, in terrace or on a pitched roof. Many connecting parts are available to adapt to different encountered cases. The VTZ Smart fans are characterized by their solidity and by an excellent energy efficiency, thanks to the use of high-performance electronic commutation motors and to an integrated pressure control device.

Electronic commutation motor for minimal consumption

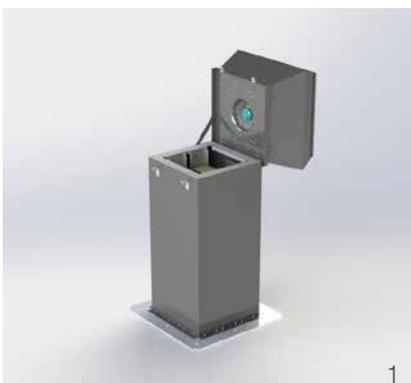

The electronic commutation motor of the VTZ Smart roof exhaust fan offers an optimum consumption all the time. Associated to the pressure control device, it automatically adjusts the consumed power to the requested airflow, while maintaining a constant pressure. The motor integrates an electric cut of switch in case of high temperature and an output which can be used to diagnose a possible default.

A wide range of adapters for all cases (2)

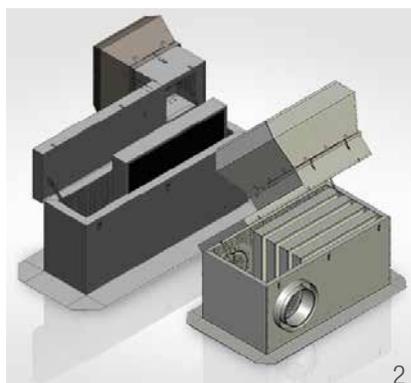

Aereco offers many adaptation parts made in aluminium or galvanised steel for pitched roofs and for the variable geometries of ducts. Specific parts can also be made custom-built on the basis of plans (contact us).

Pressure control device (3)

A system of pressure control is integrated in the roof exhaust fan, allowing to define easily the pressure at working. Pressure measured by the integrated pressure gauge is displayed on digital screen. It is automatically regulated, optimizing the system working with demand controlled exhaust units.

VCZ Smart

Collective fans for attic or outdoor installation

Low energy consumption: Electronic Commutation motor associated with an automatic pressure control device.

Solidity and reliability: metal design, made in Germany.

DCV compatible: integrated automatic pressure control device, optimizing the DCV performance.

Silent: acoustic foam on the entire envelope and sound trap available on request, optional.

Easy to install: many available adaptation parts, possibility of custom-built construction.

Easy to maintain: motor easily accessible by a trapdoor to clean the blades.

High-quality collective fans for attic or outdoor installation

The VCZ Smart attic exhaust fans offer several models with capacities from 530 m³/h up to 3500 m³/h for the equipment of collective dwellings, offices, schools or other types of buildings. They are designed for an installation in attics, on the floor, on the wall or fixed to a beam. The VCZ attic exhaust fans are characterized by their solidity and by an excellent energy efficiency, thanks to the use of high-performance electronic commutation motors and to an integrated pressure control device.

An easier maintenance (1)

The VCZ Smart attic exhaust fans are equipped with a trapdoor allowing the direct access to the motor for the propeller cleaning. The latches can be padlocked.

NEW Specific versions for outdoor installations (2)

The VCZ Smart fan range offers versions for outdoor installations including a rain protection cover as presented on the picture.

Pressure control device (3)

A system of pressure control is integrated in the fan, allowing to define easily the pressure at working. Pressure measured by the integrated pressure gauge is displayed on digital screen. It is automatically regulated, optimizing the system working with demand controlled exhaust units.

AWN SYSTEM AWN DV

Exhaust fan with heat recovery module
Outdoor terrace installation

Recovery of the exhaust air energy for heating or water heating through connection to heat pump.

Low energy consumption:
EC motor associated with an automatic pressure control device.

High energy performance:
equivalent to A+ class (ErP).

DCV compatible: integrated automatic pressure control device, optimizing the DCV performance.

Easy to install: many available adaptation parts, possibility of custom-built construction.

Terrace installation.

Silent: acoustic foam on the entire envelope and sound trap available on request, optional.

Easy to maintain: motor easily accessible by a trapdoor to clean the blades.

Demand controlled ventilation, even more energy efficient

The AWN range enhances again the energy performance of the root Aereco demand controlled ventilation system: by adapting the airflows according to the needs in the dwelling, the Aereco DCV system already reduces consequently the heat demand. Through recovering the heat air energy at the level of the exhaust fan, the AWN drastically reduces the energy load for the air renewal. The AWN is connected to a heat pump that can be used for water heating or air heating. The AWN range offers two types of calorigen fluid: water + glycol or refrigerant.

Decreasing the energy load of the heating system

Through this system, an important part of the energy induced by the ventilation can be recovered and then be reused to decrease the energy demand of the energy generating system. In the presence of a heat pump for heat generation, this energy can be directly integrated into the heat source circuit (brine or air). In the case of other heat generators, this energy quantity can be brought from the exhaust air to a temperature level (max. 50°C) by means of an autonomous heat pump. Thus, for example, the preheating of the hot water is possible or is provided in a buffer store for the heating and / or hot water. In the case of combined use of the ventilation and heat pump technology, a heat exchanger is installed in front of the exhaust fan. The remaining usable energy is extracted from the exhaust air. Intelligent control optimizes the supply and demand of energy from exhaust air and outside air.

Pressure control device

A pressure control system is integrated in the fan, allowing to define easily the working pressure. Pressure measured by the pressure gauge is displayed on digital screen. It is automatically regulated, optimizing the system working with demand controlled exhaust units.

Easy maintenance

The AWN DV exhaust fans are equipped with a trapdoor allowing the direct access to the motor for the propeller cleaning.

AWN SYSTEM AWN RV

Exhaust fan with heat recovery module
Under roof or outdoor installation

Recovery of the exhaust air energy for heating or water heating through connection to heat pump.

Low energy consumption:
EC motor associated with an automatic pressure control device.

High energy performance:
equivalent to A+ class (ErP).

DCV compatible: integrated automatic pressure control device, optimizing the DCV performance.

Easy to install: many available adaptation parts, possibility of custom-built construction.

Under roof or outdoor installation (special version).

Silent: acoustic foam on the entire envelope and sound trap available on request, optional.

Easy to maintain: motor easily accessible by a trapdoor to clean the blades.

Demand controlled ventilation, even more energy efficient

The AWN range enhances again the energy performance of the root Aereco demand controlled ventilation system: by adapting the airflows according to the needs in the dwelling, the Aereco DCV system already reduces consequently the heat demand. Through recovering the heat air energy at the level of the exhaust fan, the AWN drastically reduces the energy load for the air renewal. The AWN is connected to a heat pump that can be used for water heating or air heating. The AWN range offers two types of calorigen fluid: water + glycol or refrigerant.

Decreasing the energy load of the heating system

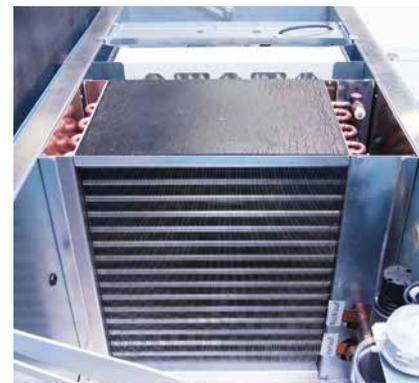

Through this system, an important part of the energy induced by the ventilation can be recovered and then be reused to decrease the energy demand of the energy generating system. In the presence of a heat pump for heat generation, this energy can be directly integrated into the heat source circuit (brine or air). In the case of other heat generators, this energy quantity can be brought from the exhaust air to a temperature level (max. 50°C) by means of an autonomous heat pump. Thus, for example, the preheating of the hot water is possible or is provided in a buffer store for the heating and / or hot water. In the case of combined use of the ventilation and heat pump technology, a heat exchanger is installed in front of the exhaust fan. The remaining usable energy is extracted from the exhaust air. Intelligent control optimizes the supply and demand of energy from exhaust air and outside air.

Pressure control device

A pressure control system is integrated in the fan, allowing to define easily the working pressure. Pressure measured by the pressure gauge is displayed on digital screen. It is automatically regulated, optimizing the system working with demand controlled exhaust units.

Easy maintenance

The AWN RV exhaust fans are equipped with a trapdoor allowing the direct access to the motor for the propeller cleaning.

VBP

Assistance fan for hybrid ventilation

Hybrid working: does not interfere with natural ventilation when stopped / at very low speed.

Not critical: allows natural ventilation if the fan stops.

Low energy consumption: only 16 W at 300 m³/h.

Constant pressure: fitted to demand controlled ventilation.

Adapts to weather conditions: management system (MS version) with temperature sensor.

Easy to install: on natural ventilation ductwork (renovation or new building).

Low maintenance: low air speed = less dust accumulation.

Optimizing the performance of passive stack ventilation

Installed at the top of a ventilation duct, the VBP hybrid fan guarantees a satisfactory airflow all year long on a former natural ventilation installation. By creating additional pressure when the natural draught is not sufficient, as may sometimes happen in warm and hot weather, the VBP hybrid fan optimises the working of natural ventilation while leaving its dimensions unchanged (ventilation exhaust units and air ducts). Its patented principle is specially designed to allow both mechanical and natural exhaust modes: the exhaust fan can work at very low speed when the stack effect is sufficient without creating any pressure loss. Its motor speeds up when the temperature increases, to compensate for a potential loss of stack effect. With a consumption of only a few Watts per dwelling, the VBP hybrid fan is an excellent alternative to mechanical exhaust ventilation and natural ventilation. Its sizing makes it suitable for apartment blocks up to 7 storeys.

Unique design for operation in passive stack ventilation (1)

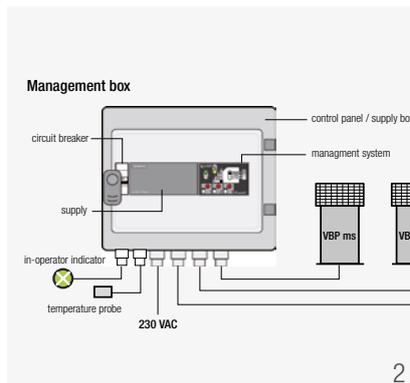

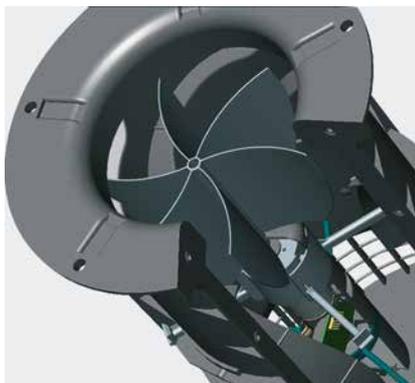

With its unique design, the VBP does not induce any pressure loss when stopped: its central blades are parallel to the airflow, and static paddles located outside the vertical airflow generate the pressure in operation. This allows normal operation of the passive stack ventilation when the fan is off.

Management system (2)

In the MS version (management system), the VBP is wired to a box which controls the simultaneity of operation and the power of several fans. The device also controls fan speeds according to the outdoor temperature or wind speed (different versions).

Thermal protection against extreme cold (3)

Available as an accessory, polystyrene thermal insulation protects the VBP motor from freezing in very cold climates.

VBP+

Assistance fan for hybrid ventilation

Hybrid working: allows natural ventilation when stopped / at very low speed.

Not critical: ensures natural ventilation if the fan stops.

Low energy consumption: only 35 W at 800 m³/h*.

Constant pressure: adapted to demand controlled ventilation

Fire safety: can withstand hot smoke up to 400°C for 30 mn

Adapts to weather conditions: management system (ms version) with temperature sensor.

Renovation or new building, on natural ventilation ductwork.

Alarm output (ms version).

Low maintenance: low air speed = lower dusting.

*@ 20 Pa

Hybrid ventilation, more energy efficient than ever

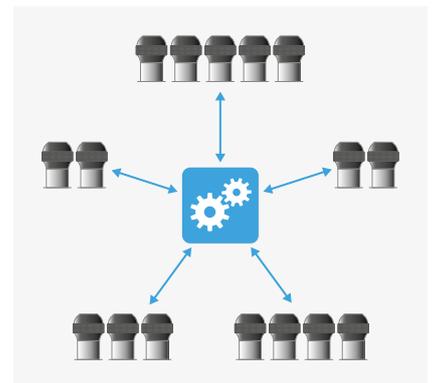

The VBP+ hybrid ventilation fan range is the ideal solution for the renovation of buildings equipped with natural or passive stack ventilation ducts, improving the performance of the ventilation through a very low electrical consumption. Its hybrid working, at very low pressure, (natural or mechanical mode) enables to automatically adapt to weather conditions to keep the pressure in the ductwork, all year long. The VBP+ is specially designed for demand controlled ventilation (humidity sensitive, presence detection or other activation modes) thanks to its pressure management. Located on a terrace or on a slope roof, the VBP+ is easily installed on the top of chimney through adaptation parts. Its large free area (equivalent to 8 ducts of ø125 mm) allows to gather several collective or individual ducts without reducing the cross section. Not critical in case of supply default with its patented blades design (no pressure losses when stopped), the VBP+ requires a very light maintenance in comparison with standard mechanical systems, making of it a privileged solution for social housing. Equipped with an EC motor, the VBP+ has a very low energy consumption. The VBP+ exists in two versions, both fire resistant, which enable the VBP+ C4 and the VBP+ R to withstand to hot smoke up to 400°C for 30 minutes.

Patented smart blades design (1)

The unique smart propeller design of VBP+ prevents from creating pressure loss when stopped: the central blades are parallel to the airflow, the airflow being generated through static peripheral paddles. Thus, the system is not critical in case of supply failure (natural ventilation working mode). The C4 version offers a galvanised steel propeller; the R version is equipped with a plastic one.

Fire safety (2)

The VBP+ fan range offers a very high level of fire safety: thanks to body and structure in galvanized steel and their patented design, the R version and the C4 version enable to extract smoke up to 400 °C, at their nominal airflow, during 30 minutes. Thanks to the non-combustible matrix made of calcium silicate protecting the motor, the C4 version can still operate to fire smoke up to 400°C, at least during 30 minutes.

DX SYSTEM DXR

Heat recovery unit for ceiling installation

DCV Contant pressure fitted to demand controlled exhaust units.

DynamiX® Technology*: ensures a silent system and optimal indoor air quality*.

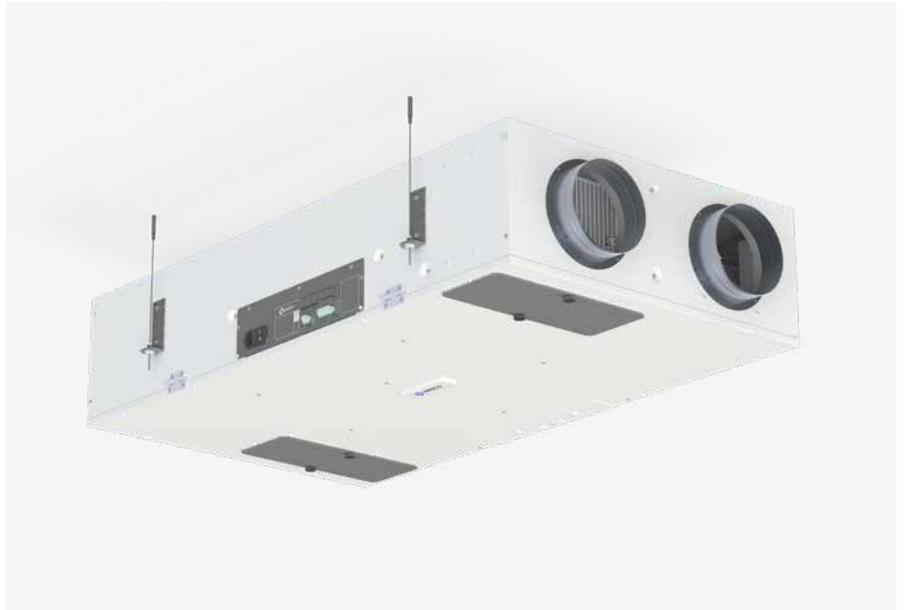

W Very low energy consumption by combining demand control of airflows and heat recovery.

+ Easy installation in ceiling spaces thanks to its small thickness (only 26 cm).

+ Easy maintenance of the filters through compact bottom trapdoors.

High-quality manufacture with main parts, made of metal.

*specific to Excellence version

Flat heat recovery with demand control for ceiling installation

Designed for ceiling installation within the heated space, the DXR provides a truly elegant solution for multi-apartments buildings, where available space for systems is often limited, particularly in renovation projects. Its very low thickness (26 cm) and its reduced width (65 cm) allow easy installation in ceiling spaces (for example in a corridor false ceiling). The DXR unit is compatible with two demand control strategies used in the DX System “Premium” and “Excellence”.

Indoor Air Quality at its best (1)

The DXR enhances indoor comfort by providing healthy air, at a milder temperature, preheated by the integrated heat exchanger. To feel good at home, the DynamiX® Technology, available on “Excellence” version, adapts, at any time, both supply and exhaust airflows to the occupants needs in every room through accurate sensors (CO₂ or presence). The DynamiX® Technology is a smart demand control strategy specific to the DX System which follows two main purposes: to reduce inherent noise from the heat recovery system while guaranteeing the best Indoor Air Quality.

Low maintenance (2)

By reducing the average airflows with an equivalent indoor air quality and thanks to a large surface of filtration, filter durability is doubled compared to traditional heat recovery systems.

Low energy consumption (3)

In addition to significant energy savings on heat losses thanks to the DynamiX® Technology, the DXR limits primary energy consumption by reducing fan power. Combining a smart and accurate demand control strategy and high quality fans, the DXR offers a very good energy performance, up to 50% reduction of electrical consumption in comparison with standard heat recovery units.

DX SYSTEM DXA

Heat recovery unit for wall installation

DCV Contant pressure fitted to demand controlled exhaust units.

DynamiX® Technology: ensures a silent system and optimal indoor air quality*.

W Very low energy consumption by combining demand control of airflows and heat recovery.

Easy installation in cupboard spaces thanks to its optimal dimensions.

Easy maintenance of the filters through designed trapdoors.

Body made of EPP, an environmental friendly material.

*specific to Excellence version

Heat recovery with demand control for wall installation

The DXA has been specifically designed for wall or cupboards installation. Thanks to its well-fitted dimensions, the DXA can be installed both in kitchen and in other technical rooms, wall-mounted. A creamy white metal sheet covers the front face of the the DXA which allows it to be unnoticed as a technical equipment. The DXA unit is compatible with two demand control strategies used in the DX System “Premium” and “Excellence”.

Indoor Air Quality at its best (1) **DynamiX® Technology**

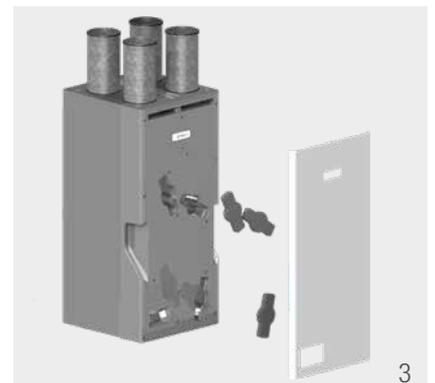

The DXA enhances indoor comfort by providing healthy air, at a milder temperature, preheated by the integrated heat exchanger. To feel good at home, the DynamiX® Technology, available on “Excellence” version, adapts, at any time, both supply and exhaust airflows to the occupants needs in every room through accurate sensors (CO₂ or presence). The DynamiX® Technology is a smart demand control strategy specific to the DX System which follows two main purposes: to reduce inherent noise from the heat recovery system while guaranteeing the best Indoor Air Quality.

Sustainability (2)

The main material used to produce the DXA, the EPP (Expanded Polypropylene), is a “green” material, environmentally friendly, 100% recyclable. It does not include any VOC (volatile organic compound), CFC (chlorofluorocarbon) or other compounds known to be particularly harmful to the environment.

Easy to maintain (3)

Three filters can be easily replaced without dismantling the unit, by simply removing the trapdoors. Filter durability is doubled compared to traditional heat recovery systems, notably thanks to a very large surface of filtration and demand controlled airflows. A touch screen interface enables to set the system and to warn for maintenance.

DX SYSTEM DX HUB

Active air supply distribution box

-  **DynamiX® Technology:** ensures a silent system and optimal indoor air quality through room-by-room demand control.
 -  **Noise attenuation through low pressure operation (DX Hub 5) and built in silencers (DX Hub 6).**
 -  **Easy installation thanks to multiple positioning.**
 -  **Easy maintenance with all metal parts unscrewable.**
- High-quality manufacture with main parts made of metal.**

*specific to DX Hub 5

How does the DX System control room-by-room supply and exhaust airflows

If the units used for exhaust are the same as those used in Aereco’s mechanical exhaust ventilation system, the airflow supply in the DX System “Excellence” is controlled by a specific device: the DX Hub distribution box. Using up to 5 or 6 demand controlled dampers connected to supply units, it allocates the airflow in each room according to the data received by CO₂ or presence sensors located in bedrooms and in the living room. An additional valve* is integrated to ensure the balance between total exhaust and supply air.

DX Hub range

Two products complete the DX Hub range, both are compatible to DXR and DXA. The DX Hub 5, with its outlets of D100 mm, fits perfectly for galvanized ductwork, while the DX Hub 6, with its outlets of D75 mm, is more dedicated to installation with semi-flexible ducts.

The DX Hub is the pillar of the DynamiX® Technology. With a very accurate and smart management of motorized dampers and with acoustic silencers (DX Hub 6), it ensures a soundless operation by the DX System.

Installation (1)

Thanks to the multiple localization of their inlets, it has never been so easy to install a heat recovery ventilation system. Whatever the heat recovery unit, the DX Hubs can be installed in a vertical or horizontal position. With different mounting brackets, the DX Hub range suits for both ceiling and wall mounting.

S-SERIE

Indoor air quality sensors with digital and analog outputs

Accurate device to measure CO₂ concentration reliably.

Accurate measurement of VOC concentration and odors.

Digital humidity and temperature sensor.

2 outputs for easy connection: analog (0-10V) and digital (PWM).

Can be adapted to different markets and applications.

Compact design, simple to install, ready to use.

No maintenance.

A reliable solution engineered to accurately measure indoor air quality

Aereco introduces its new range of sensors to measure the concentrations of CO₂, VOCs and humidity to control buildings HVAC system. Fully calibrated, the three sensors can be easily integrated to your HVAC system to guarantee a smart and simple building management.

S-CO2, a reliable and accurate device that enables systems to optimize indoor air quality

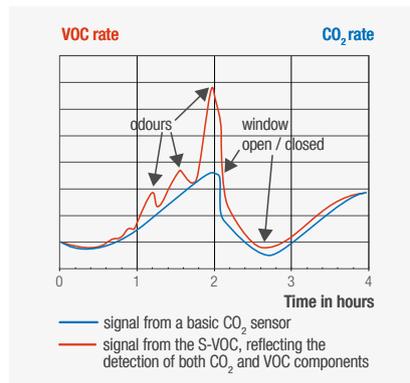

Indoor air quality can generally be assessed by measuring the concentration of carbon dioxide, known to be representative of indoor air conditions. The S-CO2 is useful in many places (such as schools, office buildings, and private homes) where the concentration of CO₂ can vary with the occupancy and use of the rooms. Its technologies ensure long-term stability and performance: the S-CO2 is pre-calibrated to measure, in real time, indoor CO₂ concentrations from 0 to 2000 ppm, and it delivers both analog (0-10 V) and digital (PWM) output signals. Thanks to its dual-beam measurement technology, the S-CO2 can be placed in any room, at any time, whatever the installed system. The Aereco CO₂ sensor integrates the NDIR technology, a selective auto-calibrated technology that allows a good assessment of the indoor air quality.

S-VOC, a smart sensor for holistic assessment of indoor air quality

The S-VOC is designed to accurately and reliably assess the level of volatile organic compounds (VOCs) typically associated with cigarette smoke, cooking smells and other pollutants. Using the MOS technology, the S-VOC measures the concentration of VOC and odours at a real time and evaluates the CO₂ level of the room (see graph below). Its output signal reports values from 0 to 2000 on a "ppm CO₂ equivalent" IAQ scale. This output signal is available simultaneously in two forms: analog (0-10V) and digital (PWM).

S-RH/T, a versatile unit that measures humidity and temperature

The S-RH/T is designed for applications such as demand-controlled ventilation and air conditioning where accurate measurements, excellent long-term stability, and maintenance free-operation are absolute musts. The temperature and humidity measurements are available simultaneously to optimize their contribution to comfort and health.

AIRQ²

Smart air quality monitor

Wi-Fi Enabled
Easy access to the data via your wireless network.

GSM (option)
Easy access to the data via your local mobile network .

SD card
Store your data locally.

LED display
Display the real time value.

Traffic light
Know the IAQ level and act.

RS485 Modbus
Easy connexion to BMS system.

USB power
Type-C USB power socket.

DC power
DC power supply plug.

Switch
On/Off device functions.

AirQ², the finest air quality monitor for a better understanding of the air you breathe

In today's world we are all living in a closed space where a good ventilation is needed. Studies says that a poor indoor air quality affects not only our physical health but also the mental health. In fact, **a good air quality improves the performance of the employees** by 8 to 10% and productivity by 34%.

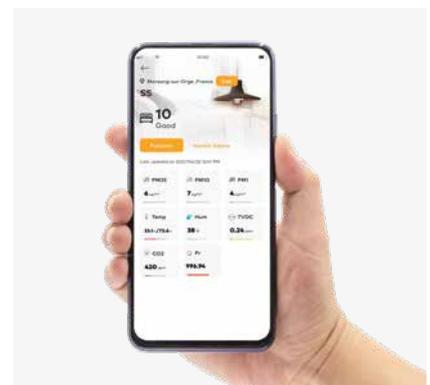

Aereco a pioneer in the field of ventilation and air quality; for more than a decade, we have been mastering the IAQ sensors and their usage. We at Aereco are continuously searching solutions for all problematics related to the **indoor air quality**.

Indeed, we are very proud to introduce the new **AirQ² monitor** which has many useful features especially the traffic lights and display of the IAQ values with smartphone app will be a must-have functions during this pandemic and beyond...

AirQ² measures eight different parameters such as CO₂, COV, PM_{2.5}, PM₁, PM₁₀, T/HR and pressure. It has two displays, LED display which shows the IAQ values and a traffic light which indicates your indoor air quality, when a set threshold exceeds, the RGB lights will change the colour into Green, yellow or red. Indeed, you can set your own threshold level with your AirQ² app. Moreover, you can access your data in real time through the app and dashboard. Furthermore, you have also the possibility to store your data locally with SD card and lot more...

Keep monitoring where you are

AirQ² has a well sophisticated app (AQI) and dashboards which helps you to know and analyse your indoor air quality in real time. The AQI software provides you your indoor and as well as your local outdoor air quality data. Furthermore, it gives you a lot of useful features for day to day life like: IAQ index, Qrcode, comparative tool and lot more... get connected and experience the smartness!

APPENDIX

Applied to two new buildings erected in Paris and near Lyon in 2007, the Performance project created an opportunity to measure precisely the efficiency of humidity sensitive mechanical exhaust ventilation in general, and of the Aereco DCV system in particular, in a large set of dwellings.

A total of 30 occupied dwellings were monitored for two years beginning in November 2007 to measure representative energy consumption and indoor air quality parameters. This monitoring led to a better understanding of the parameters that may influence ventilation performance.

On-going measurement, study, and analysis of ventilation behaviour in order to optimise the performance of our systems is, and will always be, a major concern at Aereco. By comparing theory and practice, field experiments and studies conducted in many countries have added to our knowledge of ventilation and confirmed the performance of Aereco ventilation systems. The large scale "Performance" monitoring project enabled to test the Aereco mechanical ventilation system in-situ. Here are the main results.

CO₂ concentrations lowered by Aereco ventilation system.

The measurements of CO₂ concentrations plotted in the histogram of figure 1 show that indoor air quality is maintained in a low-occupancy bedroom (one adult - light blue) and in a high-occupancy one (four adults - dark blue). The peak CO₂ concentration was shifted from 700 ppm in the low-occupancy bedroom to 950 ppm in the high-occupancy one, but even in the latter, the 1500 ppm level was exceeded for only a very few hours in the heating season.

The chart of figure 2 confirms the efficiency of the humidity sensitive air inlet on representative overnight variations compared with a simulated fixed ventilation system: **the humidity sensitive air inlet keeps the CO₂ level below 1500 ppm, but an air inlet with a fixed airflow would have led to a CO₂ level of over 2200 ppm.** The monitoring also created an opportunity to test the impact of the global system on indoor air quality: the fan was stopped for a short period (one month) and the CO₂ concentrations were compared with the other months (with ventilation) of the heating season. **The histogram of figure 3 clearly shows the value of the ventilation and its positive impact on IAQ.** When the fan was stopped, a strong rise in CO₂ concentrations (above 1900 ppm most of the time) was observed. The occupants did not react to compensate for the lack of air renewal. **This confirms the impact of ventilation on IAQ and shows that occupants are unaware of poor ventilation and fail to compensate, for instance by opening windows.**

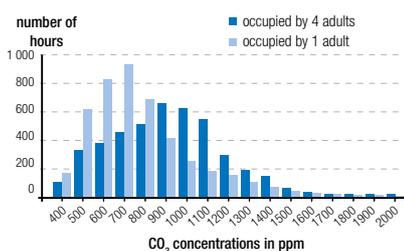

Figure 1: CO₂ concentrations in two bedrooms with different occupancy levels.

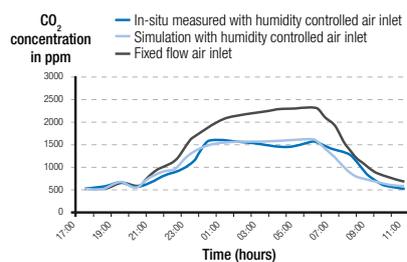

Figure 2: overnight variation of CO₂ concentrations in a bedroom. Comparison of Humidity Controlled (HC) air inlet (measured and simulated) and fixed-flow air inlet (simulated).

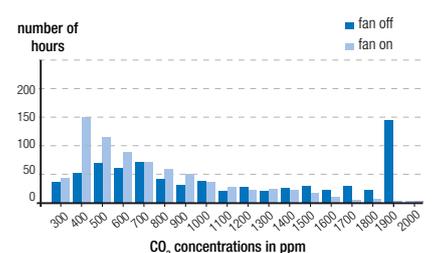

Figure 3: CO₂ concentrations with / without ventilation. Measurements for one month with fan off in a bedroom compared with fan-on for the rest of the heating season. 3 occupants in a bedroom.

MONITORING THE PERFORMANCE OF THE DEMAND CONTROLLED MEV SYSTEM

Approximately 30% energy savings on ventilation with the Aereco DCV system

The chart of figure 4 presents the average equivalent-heat-loss airflow for every dwelling in the monitoring sample during a complete heating season. The dwellings are grouped by type (number of main rooms). The differences in measured airflows result from the adaptation of the ventilation systems to different occupancy levels, activities, occupant behaviours, and dwelling sizes. The comparison with the French regulatory reference (fixed airflow, black bars) shows the statistical airflow reduction – thus the energy savings – with the DCV system. The measured savings on the airflow in this project are evaluated at 30%. But a survey showed that most of these dwellings are over-occupied, especially on the Paris site. When this result is extrapolated to the statistical average French occupancy for each type of dwelling, the result is about 55% energy savings on ventilation heat losses. This statistical airflow reduction does not affect the IAQ; indeed, the IAQ, in terms of CO₂ and humidity, has been shown to be better, as stated earlier.

Results

The large scale in-situ monitoring of 30 dwellings demonstrated the good performance of the Aereco DCV system tested: a high level of indoor air quality compared to a fixed ventilation system. The condensation risks are negligible; the monitored system yielded 30% energy savings compared with the regulatory fixed airflow in these over-occupied dwellings. An extrapolation to the statistical average French occupancy indicates 55% energy savings on heat losses. Fan energy consumption was reduced by between 35% and 50% on both sites. In addition, the in-situ working characteristics of the monitored DCV terminals were consistent with the laboratory test results.

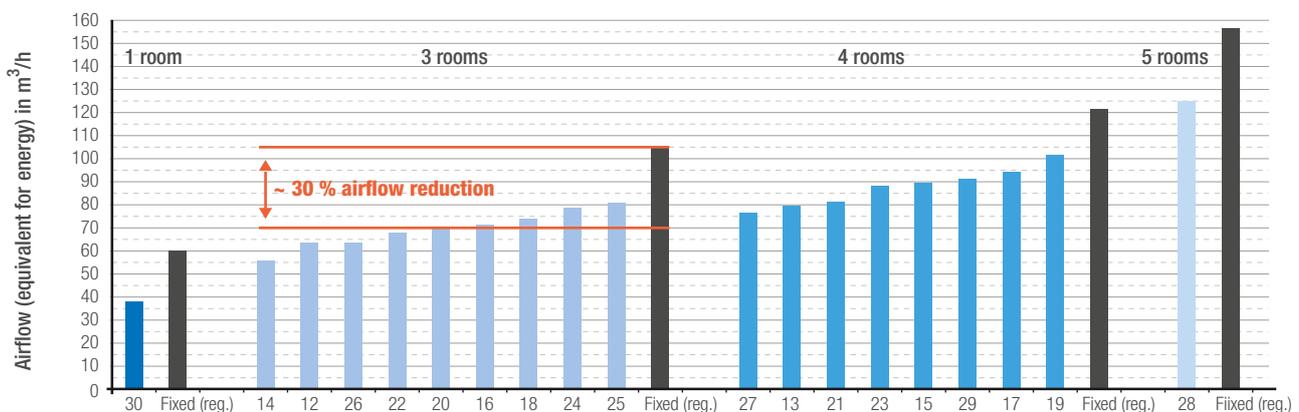

Figure 4: statistical equivalent-heat-loss airflows per dwelling (numbers in abscissa) on Paris site. Rated by dwelling types by comparison with the constant airflow required by French regulations (black). 2007-2008 heating period.

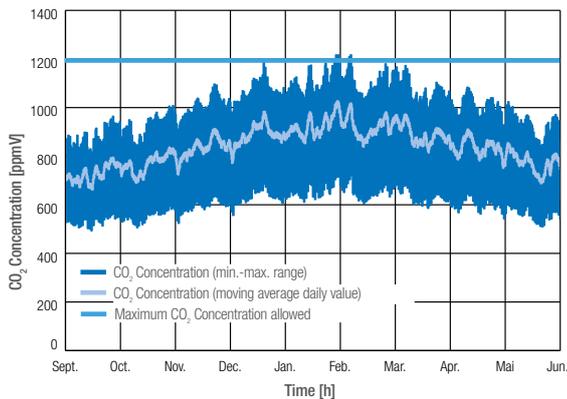

AERECO DEMAND CONTROLLED MEV¹: A RELEVANT, LOW-COST ALTERNATIVE TO CONSTANT HEAT RECOVERY VENTILATION

Environmental benefits

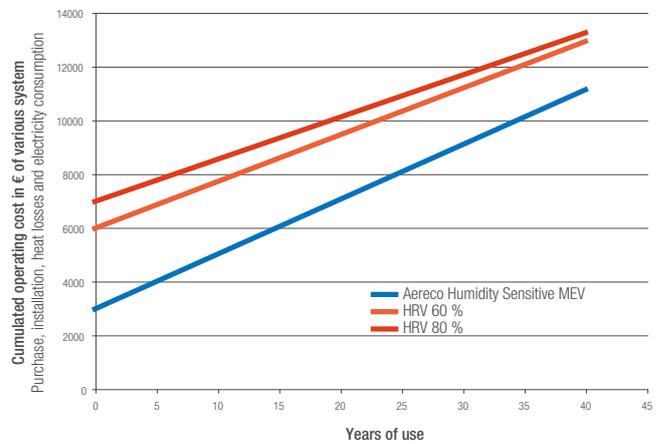

The energy performance of Aereco's demand controlled MEV system is reinforced by the fact that its single fan consumes less electricity than the two fans and preheating of the heat recovery system. With a PE-factor¹ of 2.7, **the impact on primary energy consumption – and so on CO₂ emissions – favours humidity controlled ventilation for the share of energy necessary to run the system.**

Indoor air quality

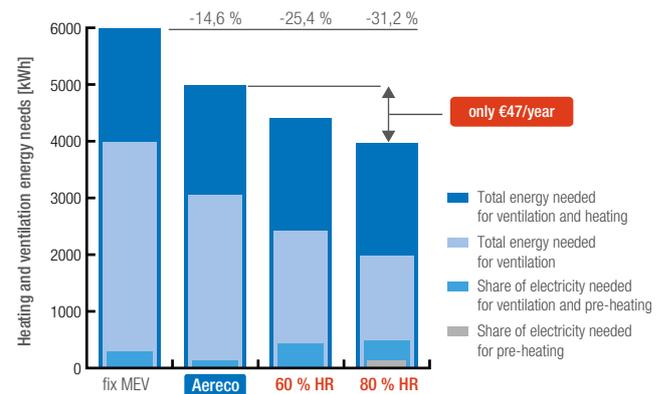

This study also showed that, under real occupancy conditions, **Aereco demand controlled MEV keeps CO₂ levels below 1200 ppm, guaranteeing optimal indoor air quality (IAQ) in the dwelling (graph no. 3).**

graph no. 3 - Daily variation of CO₂ inside the dwelling equipped with Aereco demand controlled MEV

graph no. 1 - Operating costs and R.O.I.² of various ventilation systems
Assumption: 1 kWh = €0.10 +VAT

graph no. 2 - Total energy consumption of various ventilation systems
Assumption: 1 kWh electricity = €0.19; 1 kWh Fuel oil or Gas = €0.07

1. PE = primary energy factor for electricity, value for Germany
2. R.O.I.: return of investment

VENTILATION SYSTEMS AND PRODUCT BREAKDOWN

The table below breaks the products down by type of ventilation in the residential application.

								
		Natural (PSV)	Hybrid	Low pressure MEV (LP MEV)	Mechanical (MEV), collective	MEV with HR	Mechanical (MEV), individual	Heat recovery (MVHR)

CERTIFICATIONS & REGULATIONS

ErP Directive

Commission Regulation (EU) No 1253/2014 and commission delegated regulation (EU) No 1254/2014 implementing Directive 2009/125/EC of 21st October 2009, respectively, relate to the implementation of ecodesign requirements for ventilation units and Labelling of residential ventilation units.

So, ventilation systems within the scope of this Directive, the ventilation units are being now subject to performance levels required by means of a new ErP (Energy-related Products) regulation.

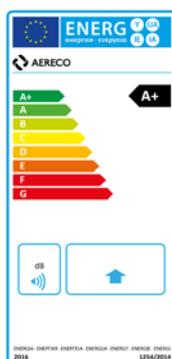

The fans, which have a power consumption less than 30 W, are not subject to this regulation, as are extra ventilation systems (individual extractions eg bathroom) or which use only in exceptional surroundings (smoke control systems in case of fire, for example).

From 1st January 2016, both of these regulations will be applied, which means that all Aereco fans and HRV will have a product information sheet available from our website to characterize them.

This sheet, applied only to ventilation units defined as residential application, defines among other things their energy SEC class while for ventilation units defined as "non-residential", this sheet will display their efficiency.

Energy labels will be attached to the products concerned to define their energy efficiency, their maximum flow rate and their sound power level. Among Aereco fan range, all are scored with the best energy labels which is from B class to A+ class.

The logo "ErP compliant" recalls that all fans Aereco covered by these rules comply with the requirements.

Aereco S.A. is ISO 9001:2008 certified.

This certification means that Aereco's Quality Management System conforms to the version (2008) of the international quality standard. It covers the whole scope of the company's activities from the design, the manufacturing process to the sales operation.

Aereco and the RoHS directive

Aereco guarantees through appropriated components specifications that all the general purpose electrical and electronical components³ used in its products are conform² to the requirements of the EU RoHS Directive¹ 2011/65/EU.

REFERENCES

Aereco ventilation systems cover various building applications and geographical locations, covering most of European countries as well as Russia, Japan and the United States notably. In new built or in renovation, for individual housing, block of flats or for commercial buildings, Aereco brings its know-how and experience to suit every project. Around 300 000 dwellings are equipped with Aereco systems every year, for a total since the birth of the company of more than 5 millions residences.
